JTL Partner Convention

JTL H4CKATHON

Hands-on Kickoff Session.

2026

JTL

Head of Platform Architecture & Developer Productivity

Sebastian Küsters

Workshop flow

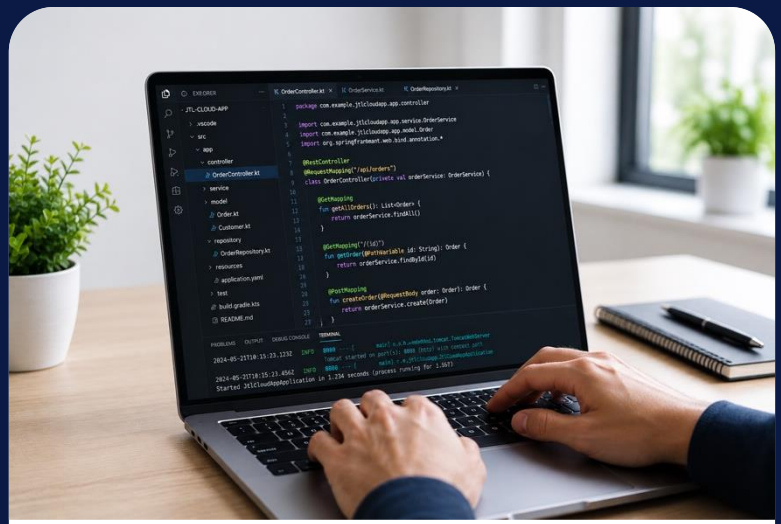

Agenda

What is the JTL Cloud Platform?

Architecture & components of a JTL Cloud App

Hands-on: Live coding a JTL Cloud App

JTL

CHAPTER 01

What is the JTL Cloud Platform?

Overview

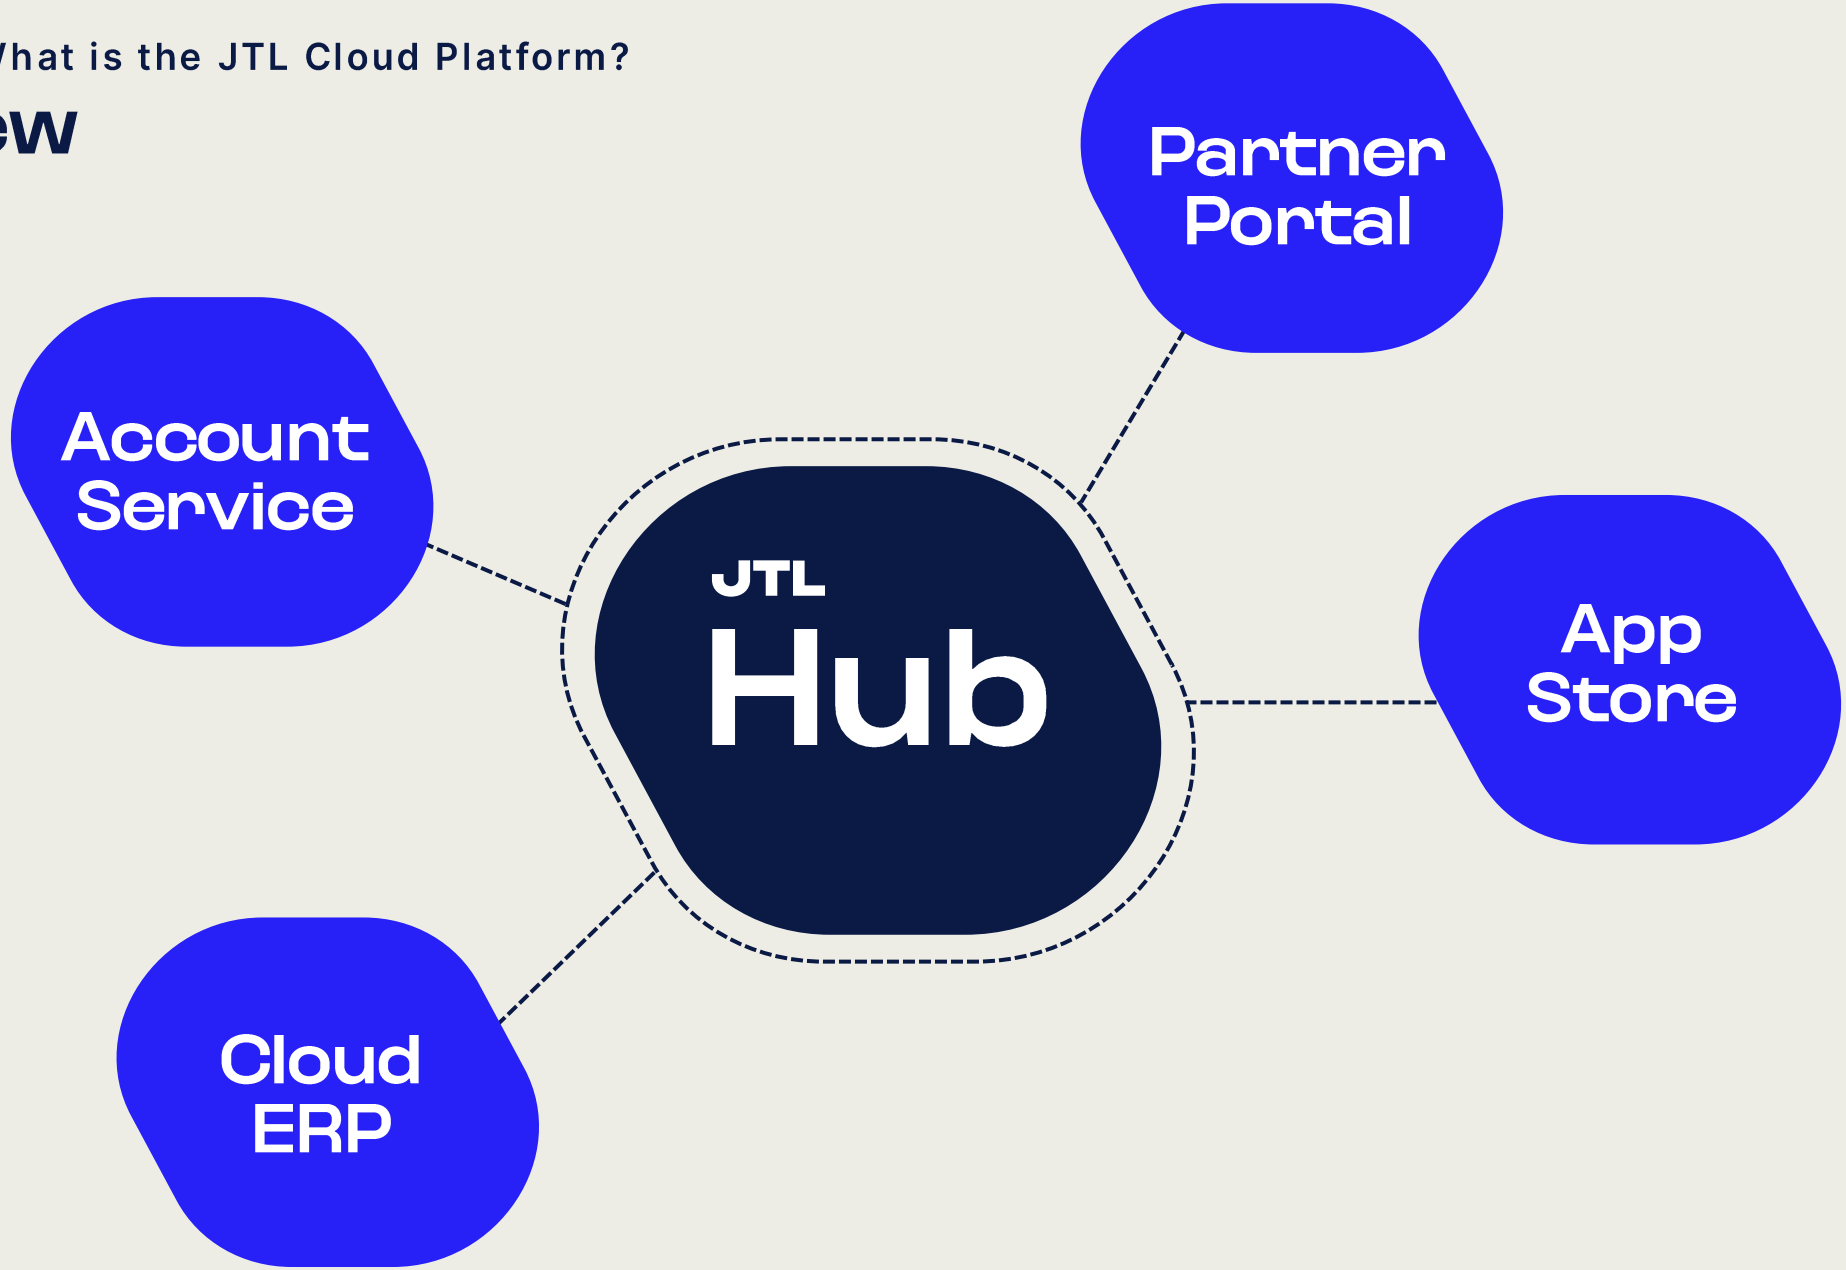

→ **Central platform for cloud-based services around the JTL ecosystem** – connects apps, integrations, and partner solutions in one environment.

→ **Complements JTL-Wawi** – Wawi remains the core element; the cloud extends processes securely and cloud-natively.

→ **Requirement for merchants:** Min. JTL-Wawi 2.0 – only this version creates the technical bridge to the cloud.

→ **Reach:** Over 50,000 JTL merchants. Apps are delivered via the App Store.

Overview

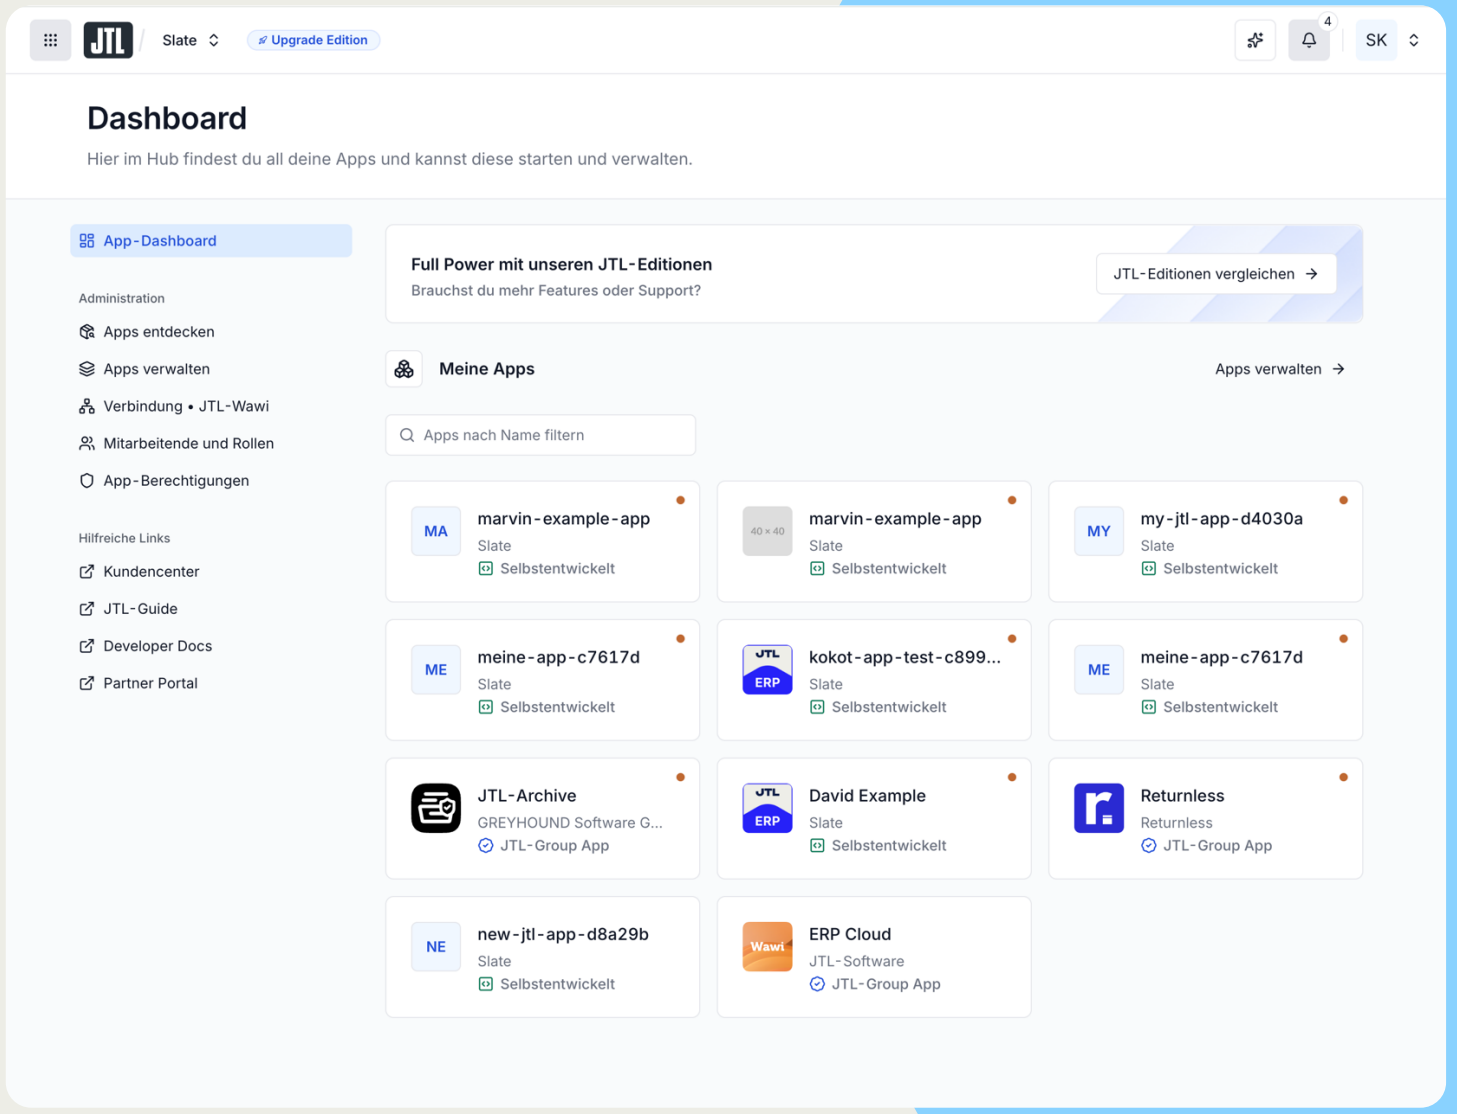

JTL Hub

→ **Entry point into the JTL Cloud**

→ **Manage...**

- Apps
- Employees & roles
- App permissions

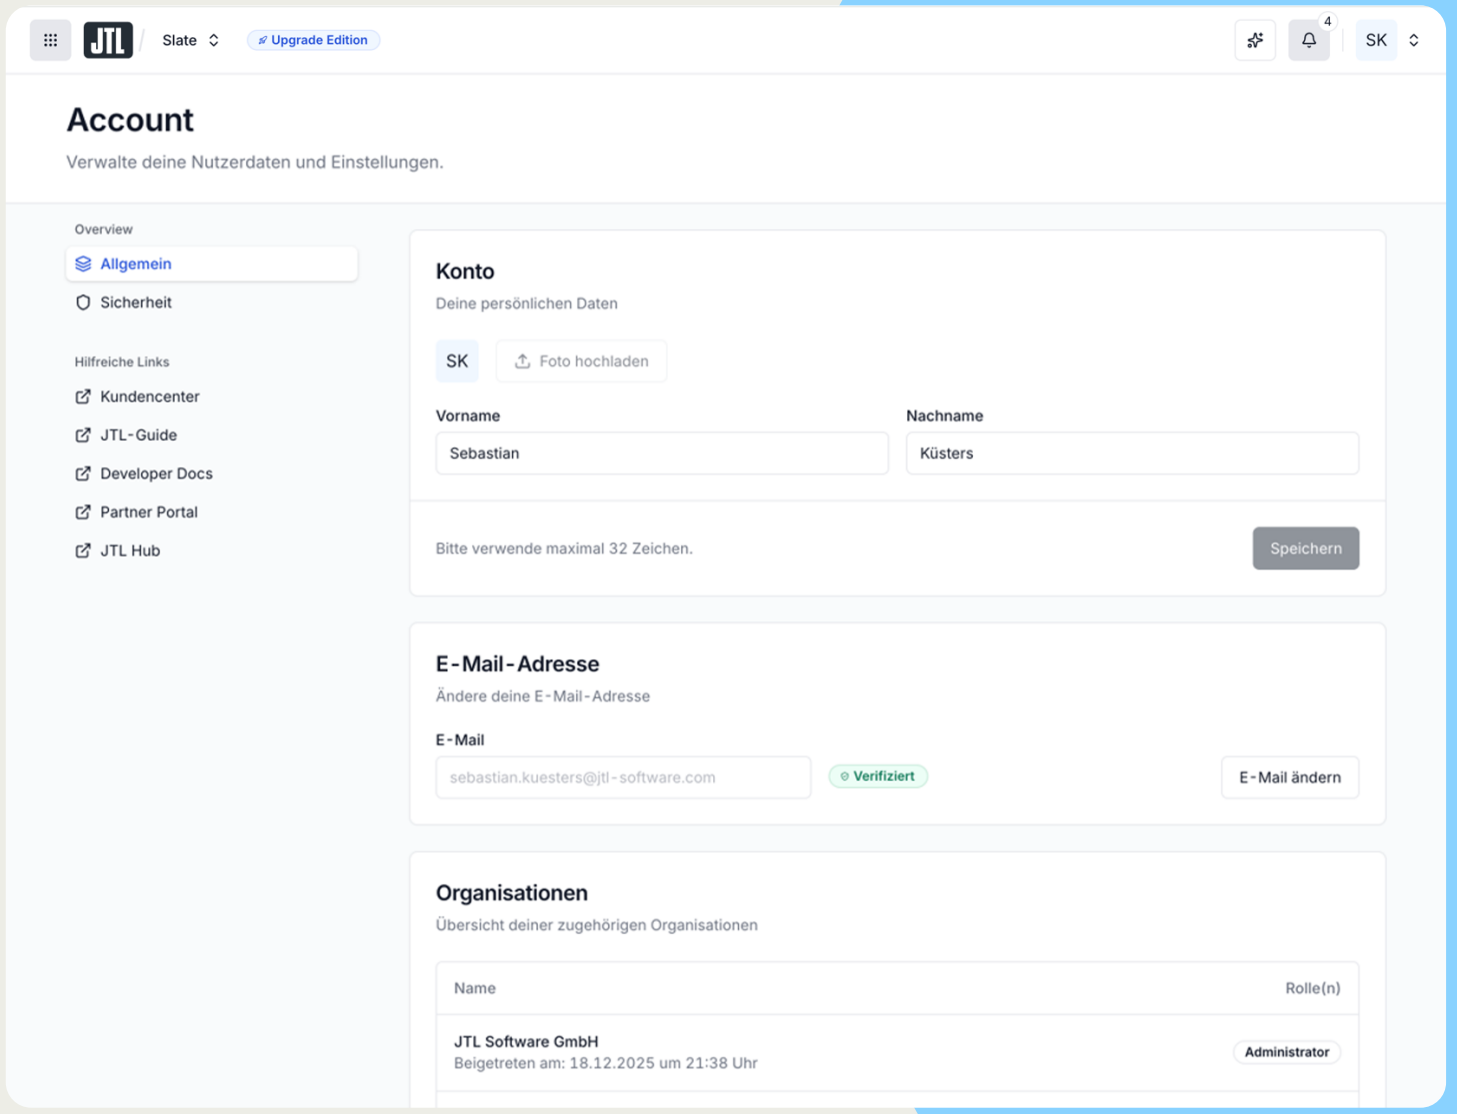

→ **Check the connection status of JTL-Wawi**

JTL Account Service

→ Manage the JTL-ID

- Set account details
- Change email address
- Adjust security factors

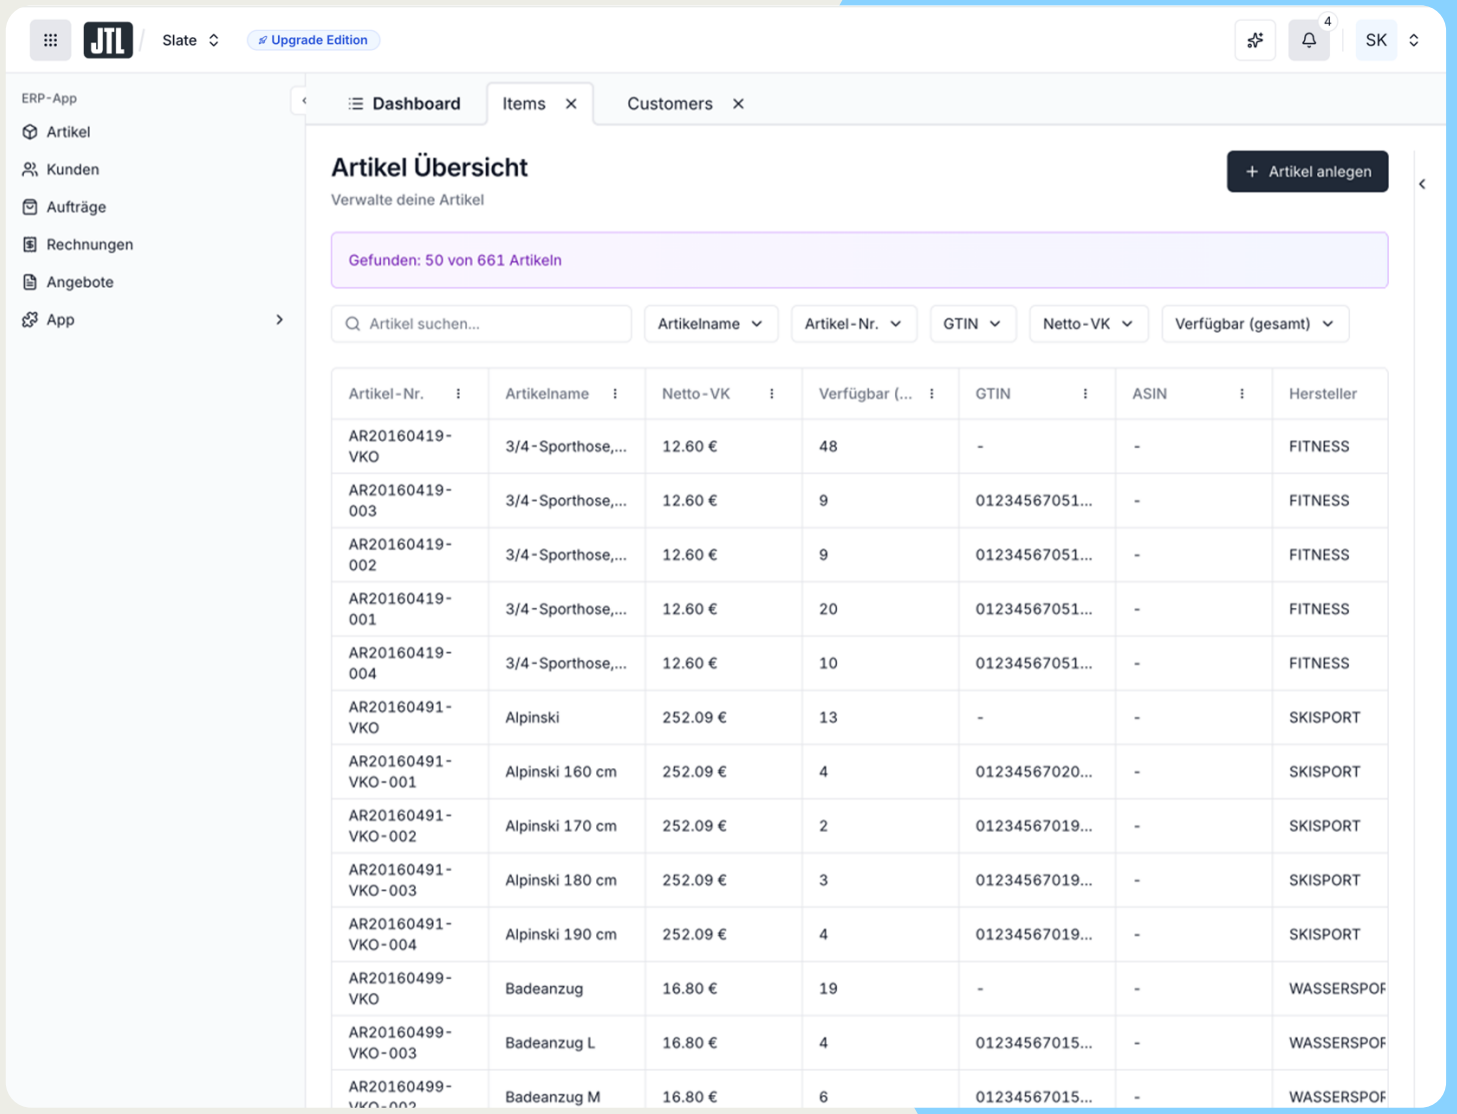

JTL Cloud ERP

→ **The web app for Wawi**

- Items
- Customers
- Orders
- Invoices
- Quotes
- Apps

→ **Requires an active connection to a Wawi**

→ **The first pre-installed app of the JTL Cloud Platform (more coming soon)**

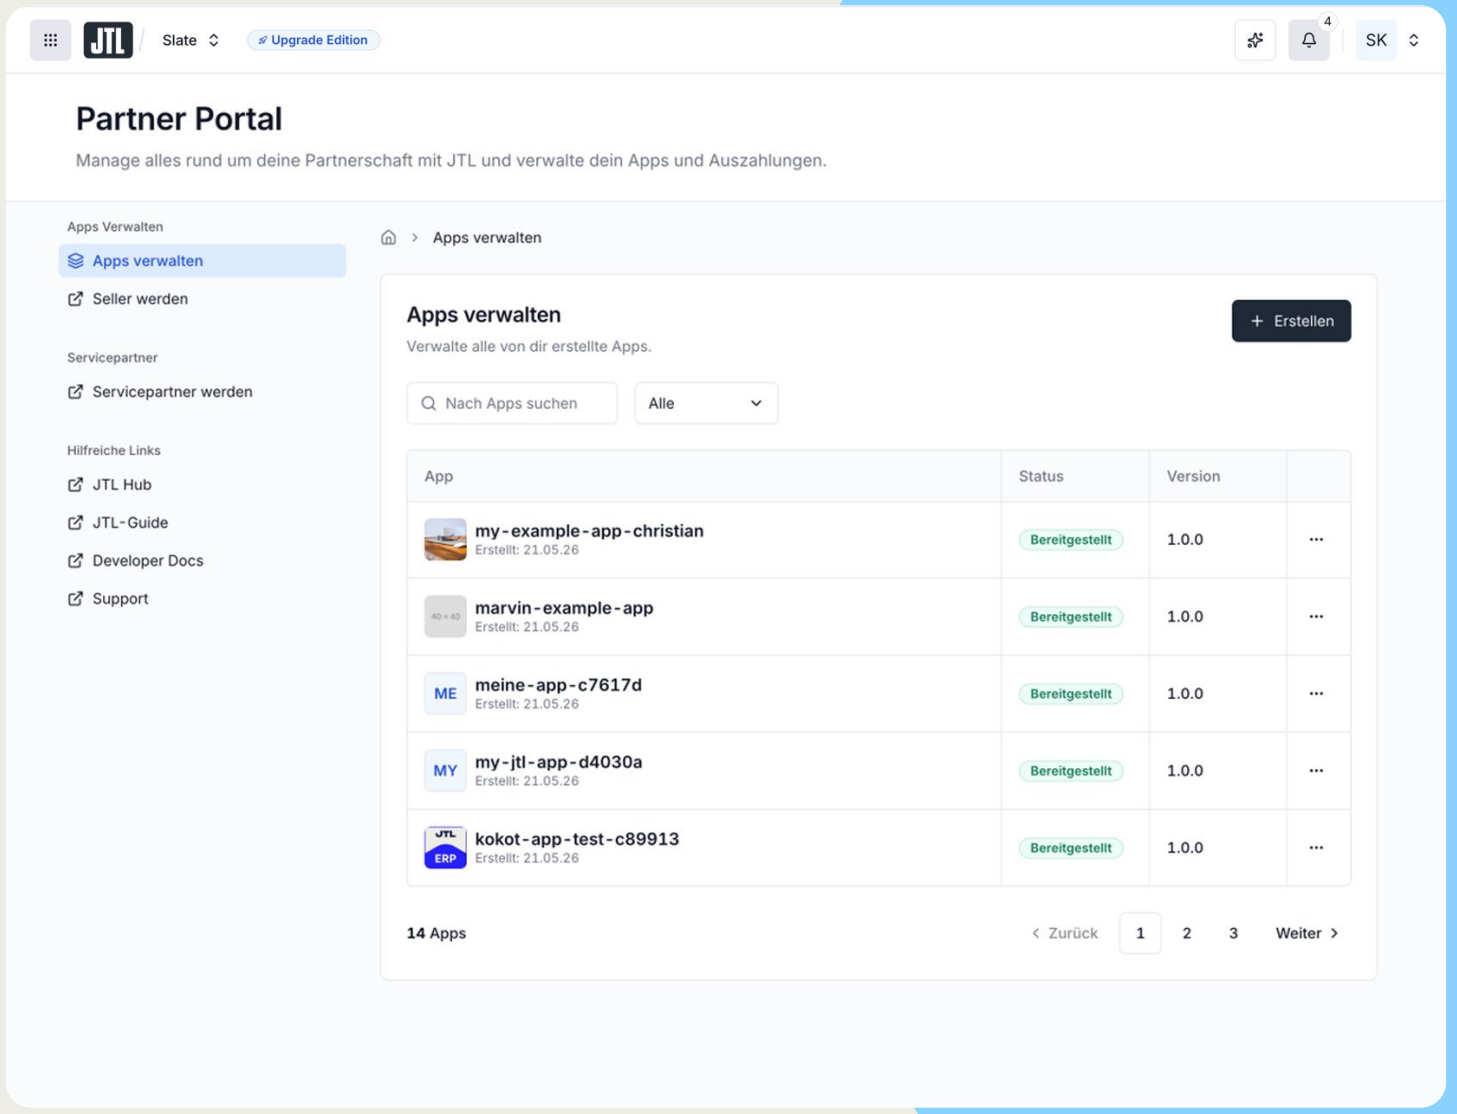

JTL Partner Portal

→ **Manage JTL partnership**

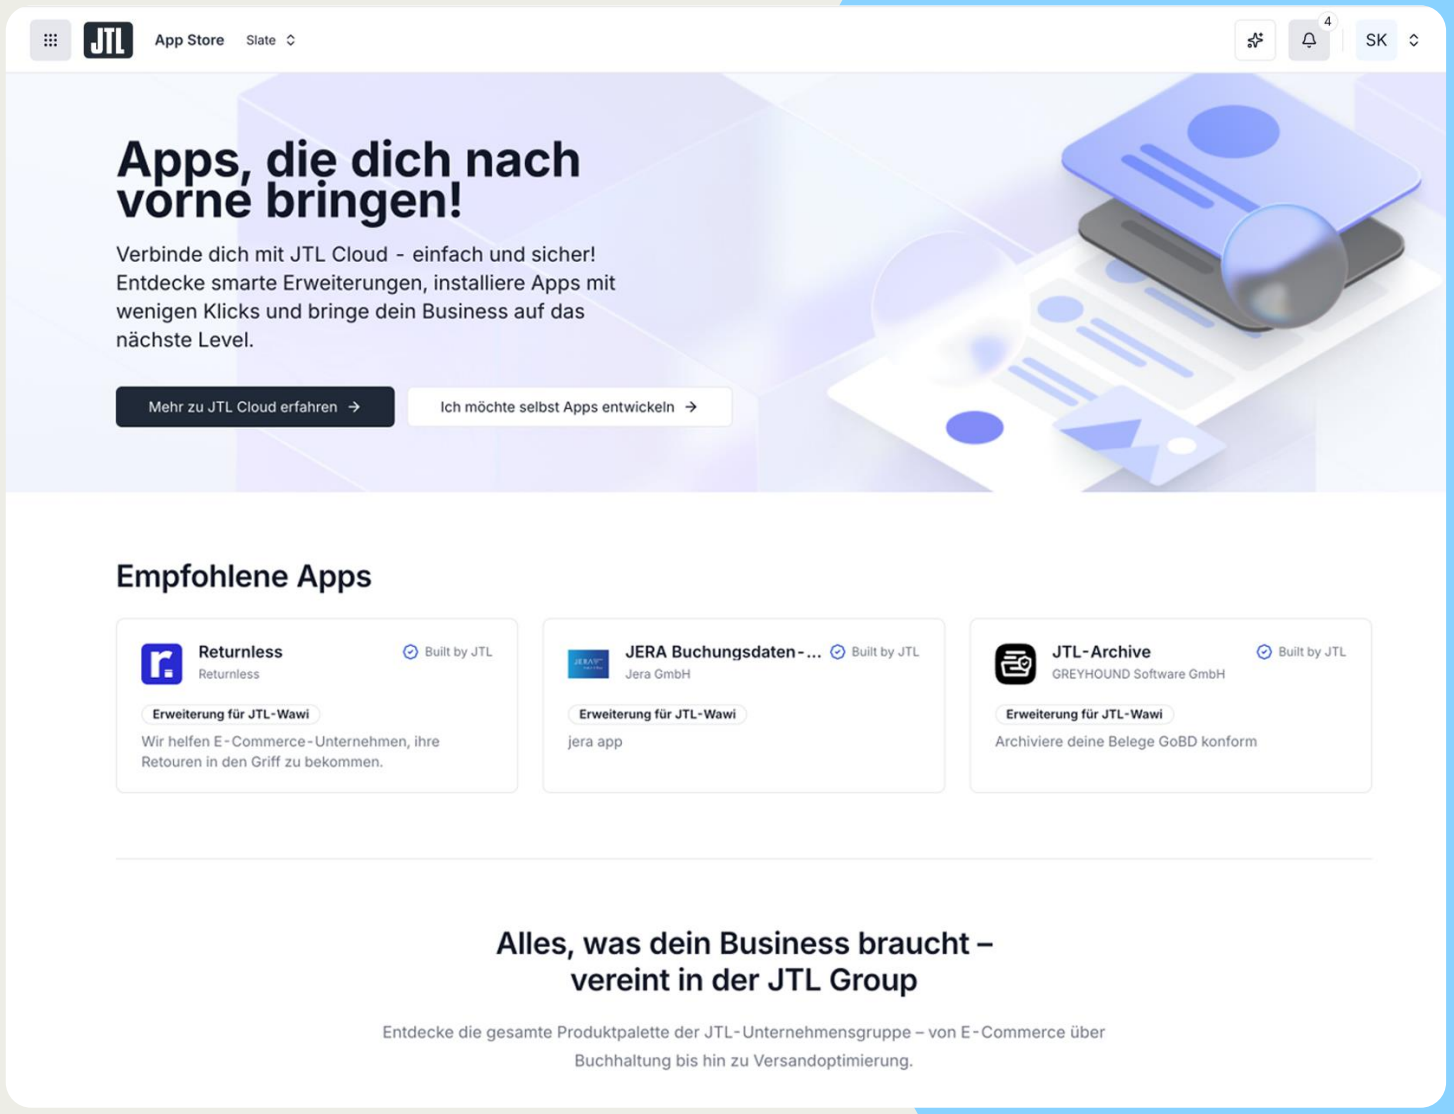

→ **Manage apps**

- Create new JTL Cloud Apps
- Edit your JTL Cloud Apps
- Publish JTL Cloud Apps

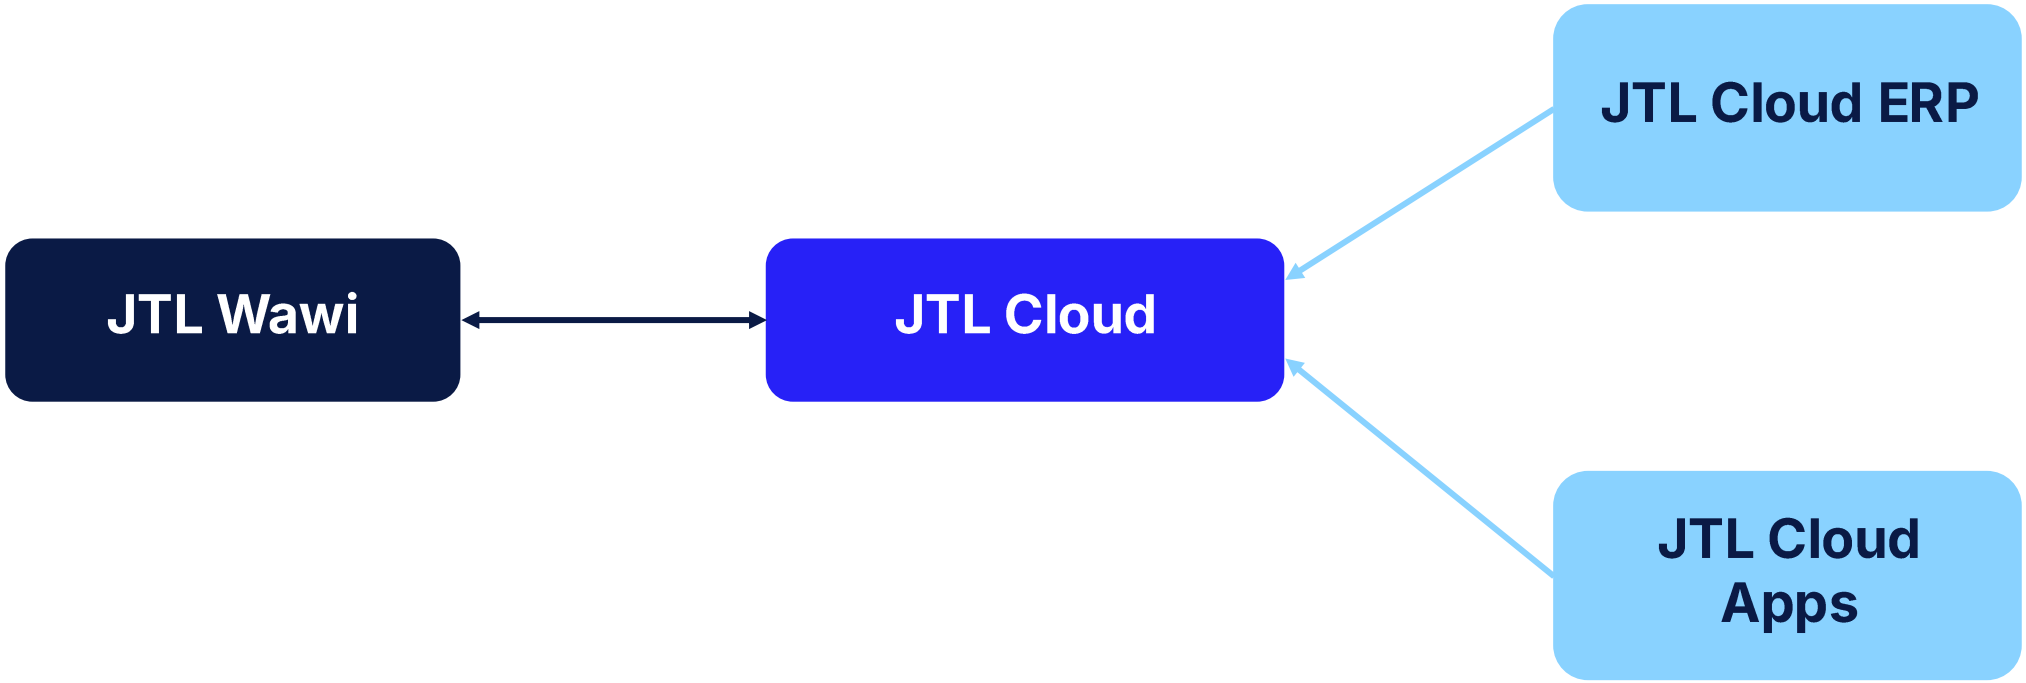

JTL App Store (coming soon)

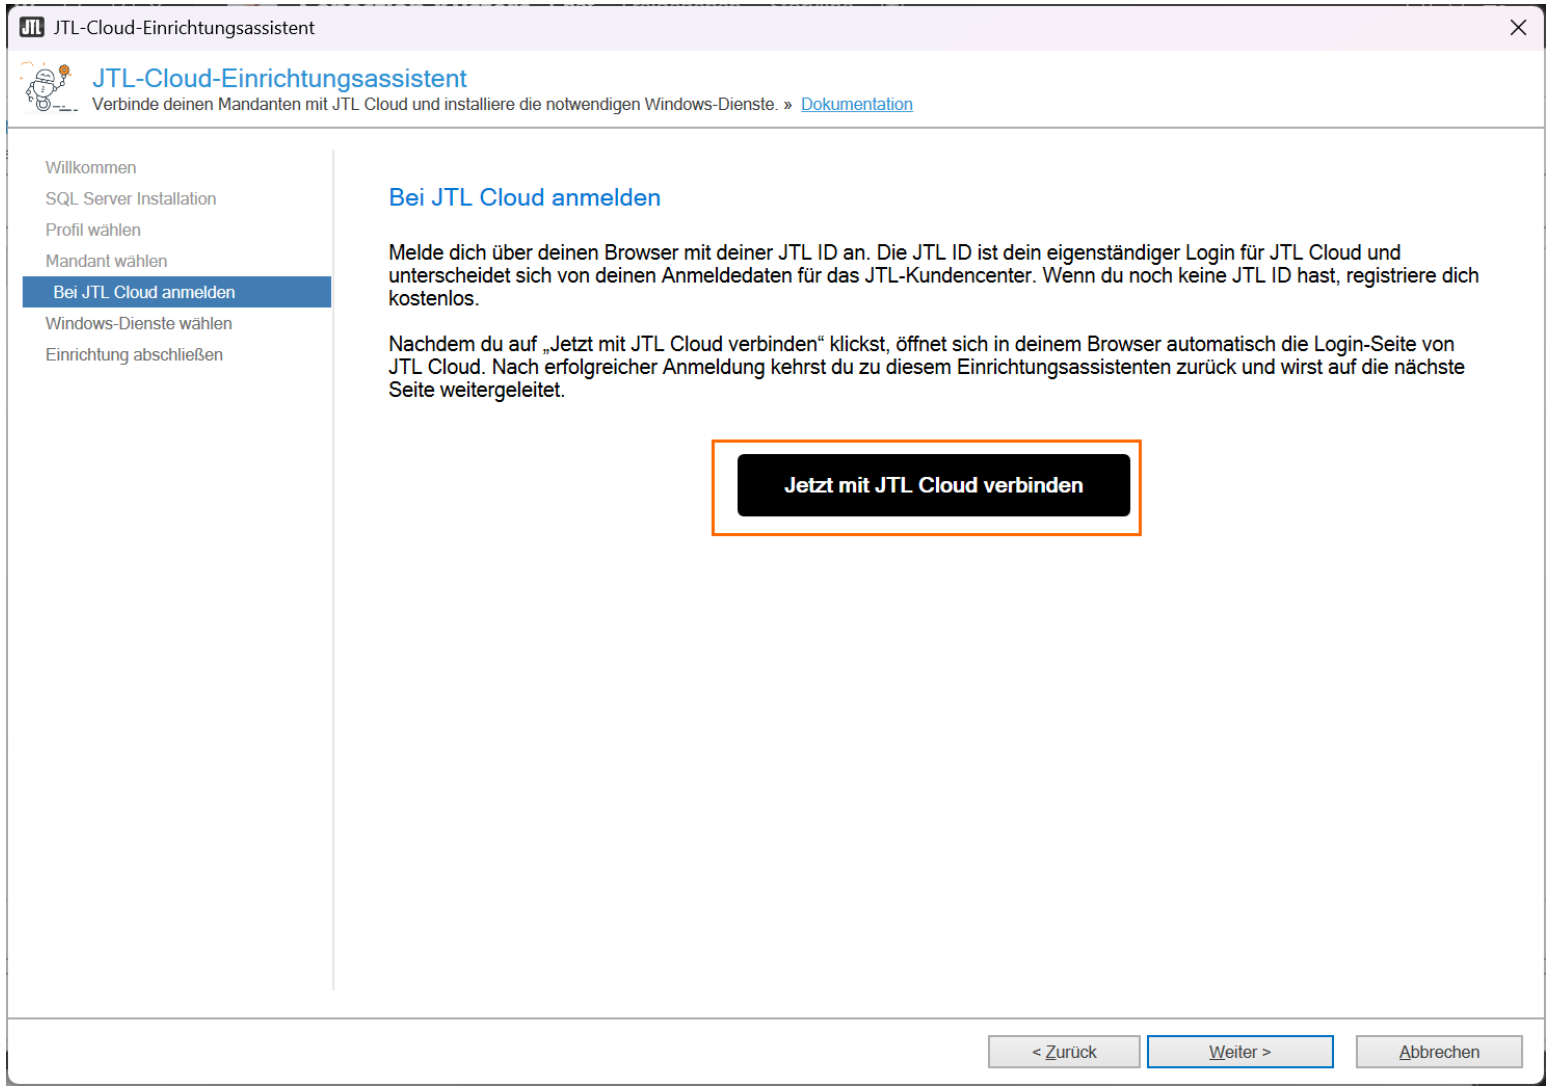

→ **Distribution channel for JTL Cloud Apps**

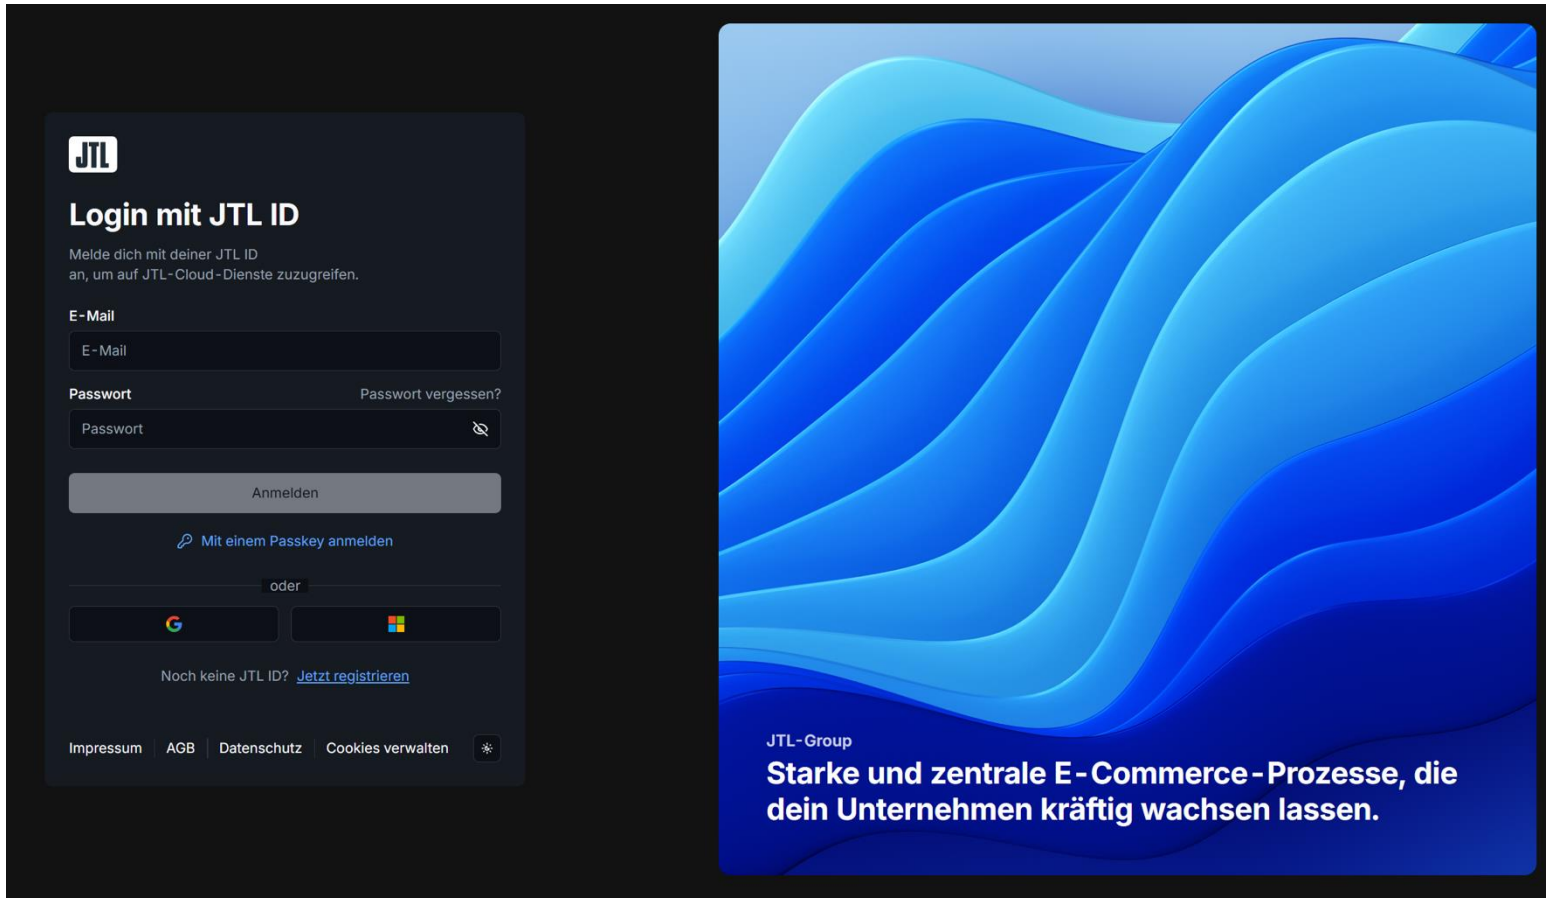

Cloud connected Wawi

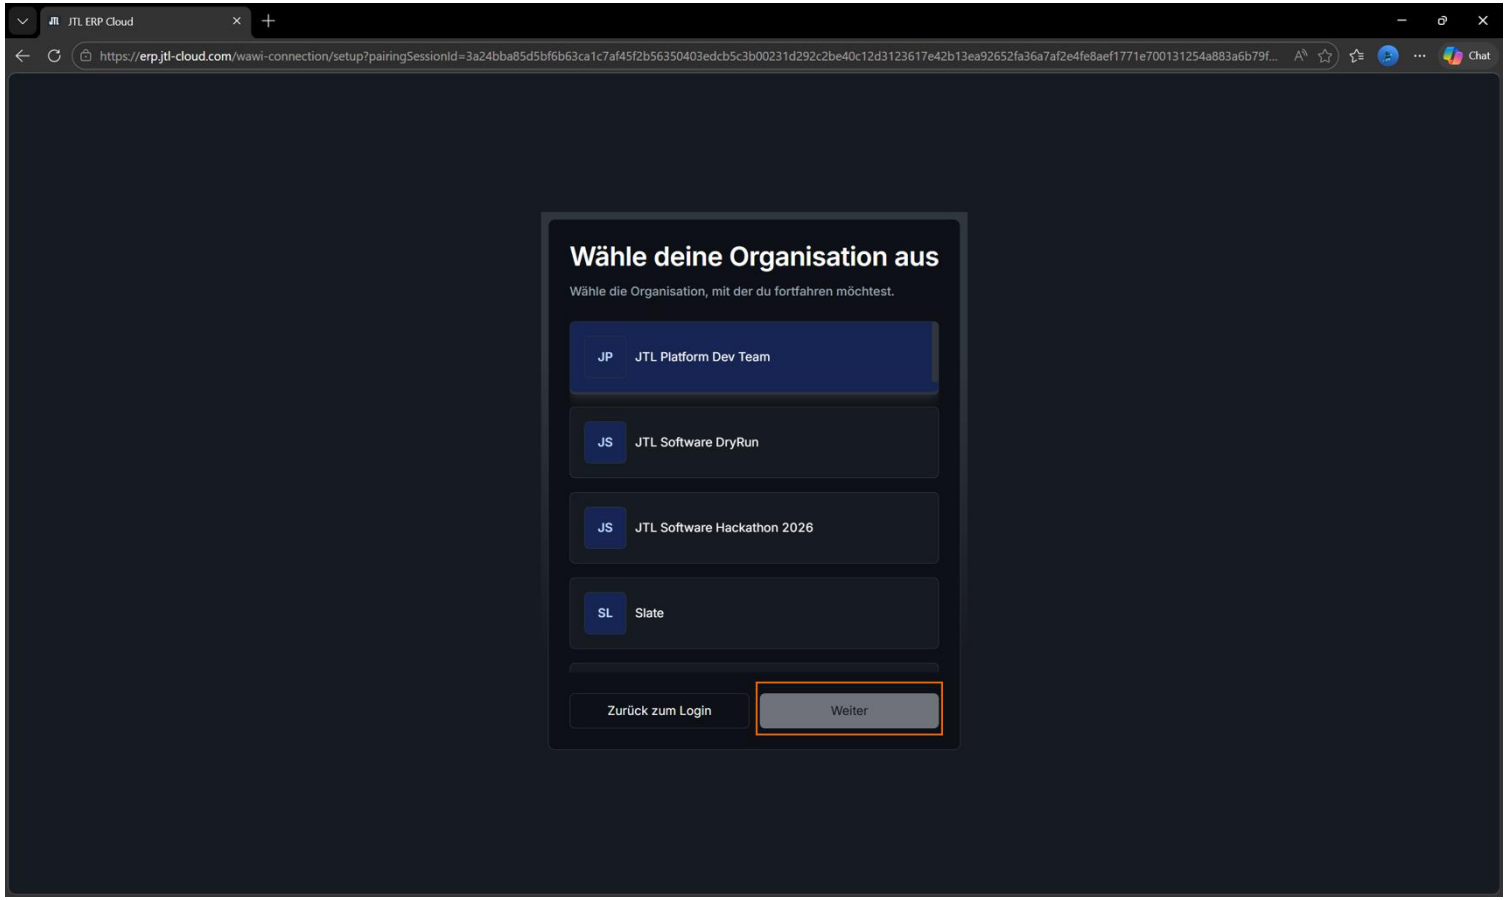

Wawi Cloud Connection Flow

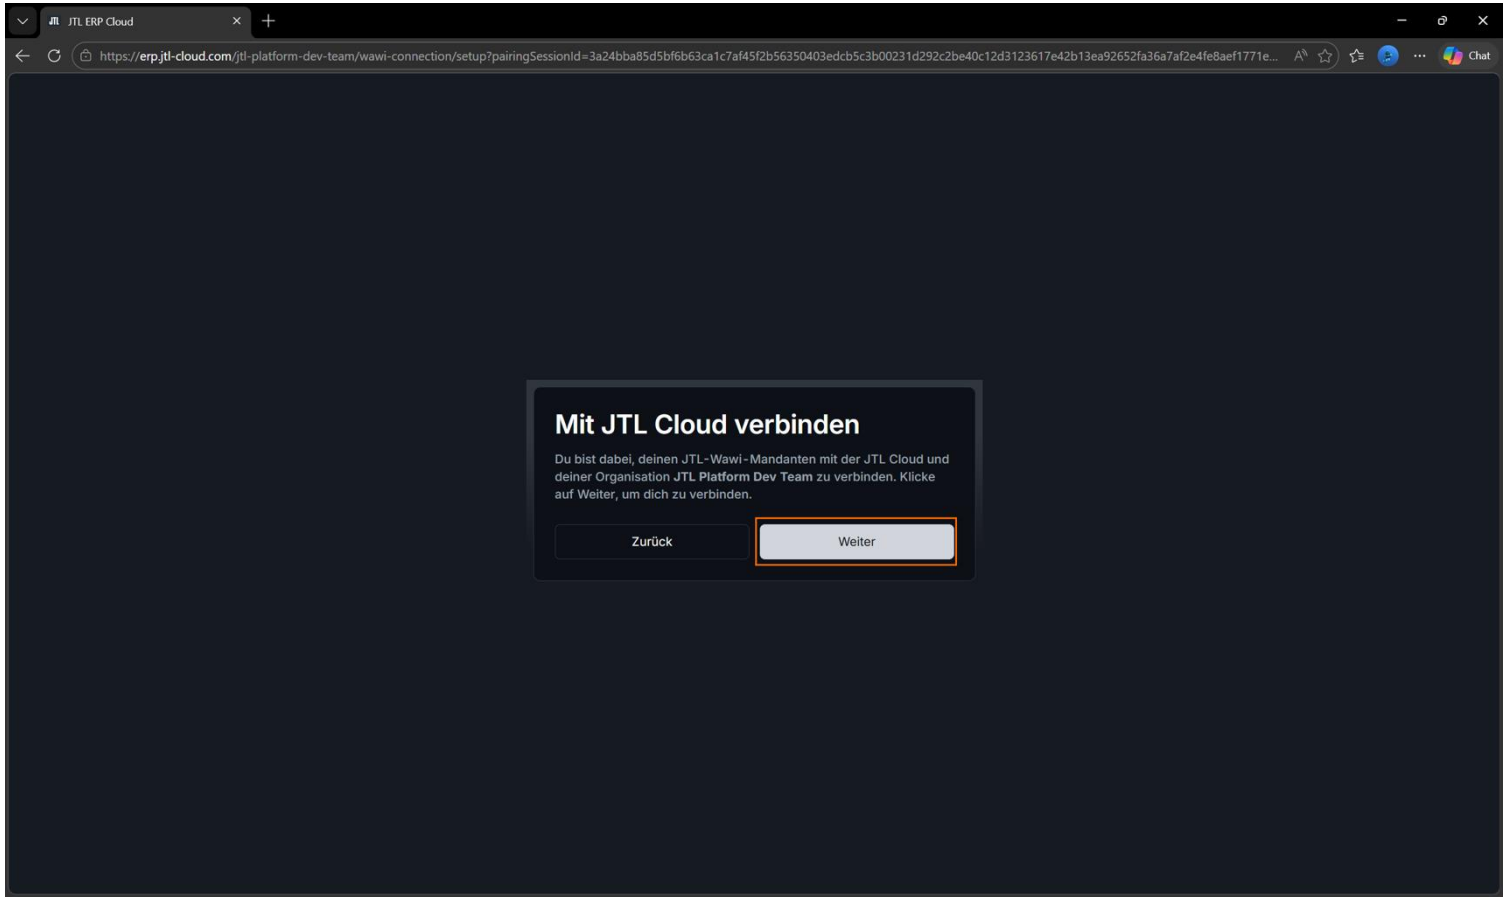

Wawi Cloud Connection Flow

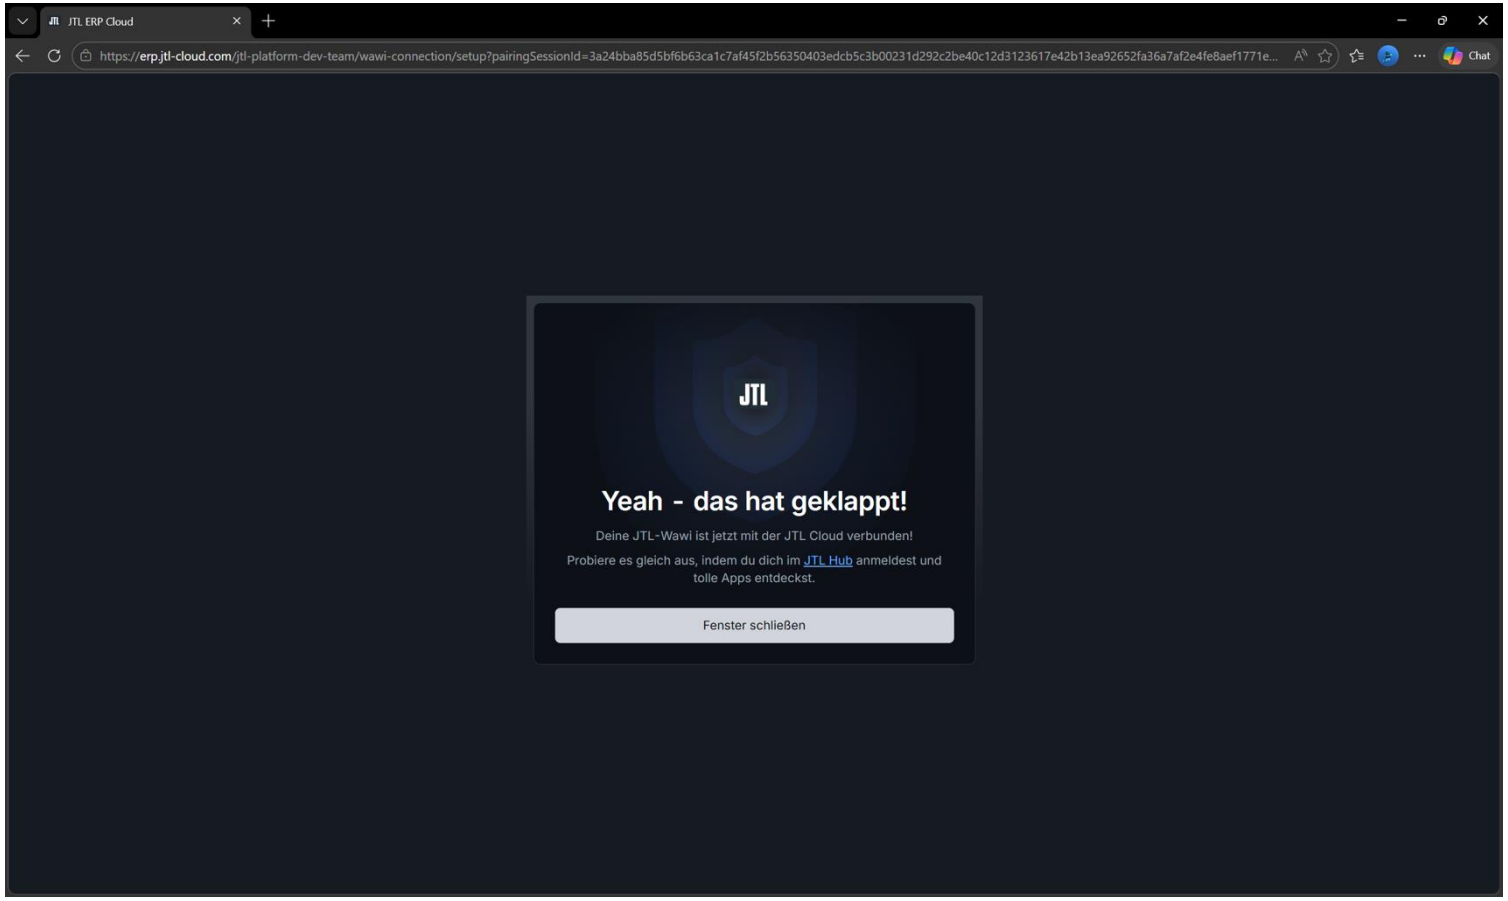

Wawi Cloud Connection Flow

Wawi Cloud Connection Flow

Wawi Cloud Connection Flow

Glossary · the key terms.

JTL Cloud The platform itself – umbrella term for all cloud-based services.

JTL Hub Central interface – where merchants install apps and manage organizations.

JTL ID Central user account – SSO and basis for permissions across all cloud services.

App Store Distribution channel – where merchants install your app.

Platform API The APIs your app backend calls to access merchant data.

App Shell The container that hosts your app's UI. It handles layout, navigation, and communication with the rest of the platform.

AppBridge Communication layer between App Shell and your app – events and lifecycle.

Status · Beta.

Early stage, lots of room to shape it

Currently only in production for pilot customers – individual areas are explicitly “in development”.

For you, that means: you’re building on the architecture that will be in place for the coming years.

JTL

CHAPTER 02

Architecture & components of a JTL Cloud App

The four integration types (more coming soon)

Cloud App with UI in the Hub

Your app as part of the Hub App Dashboard.

Cloud ERP Menu item

Extend the Cloud ERP Menu with your app

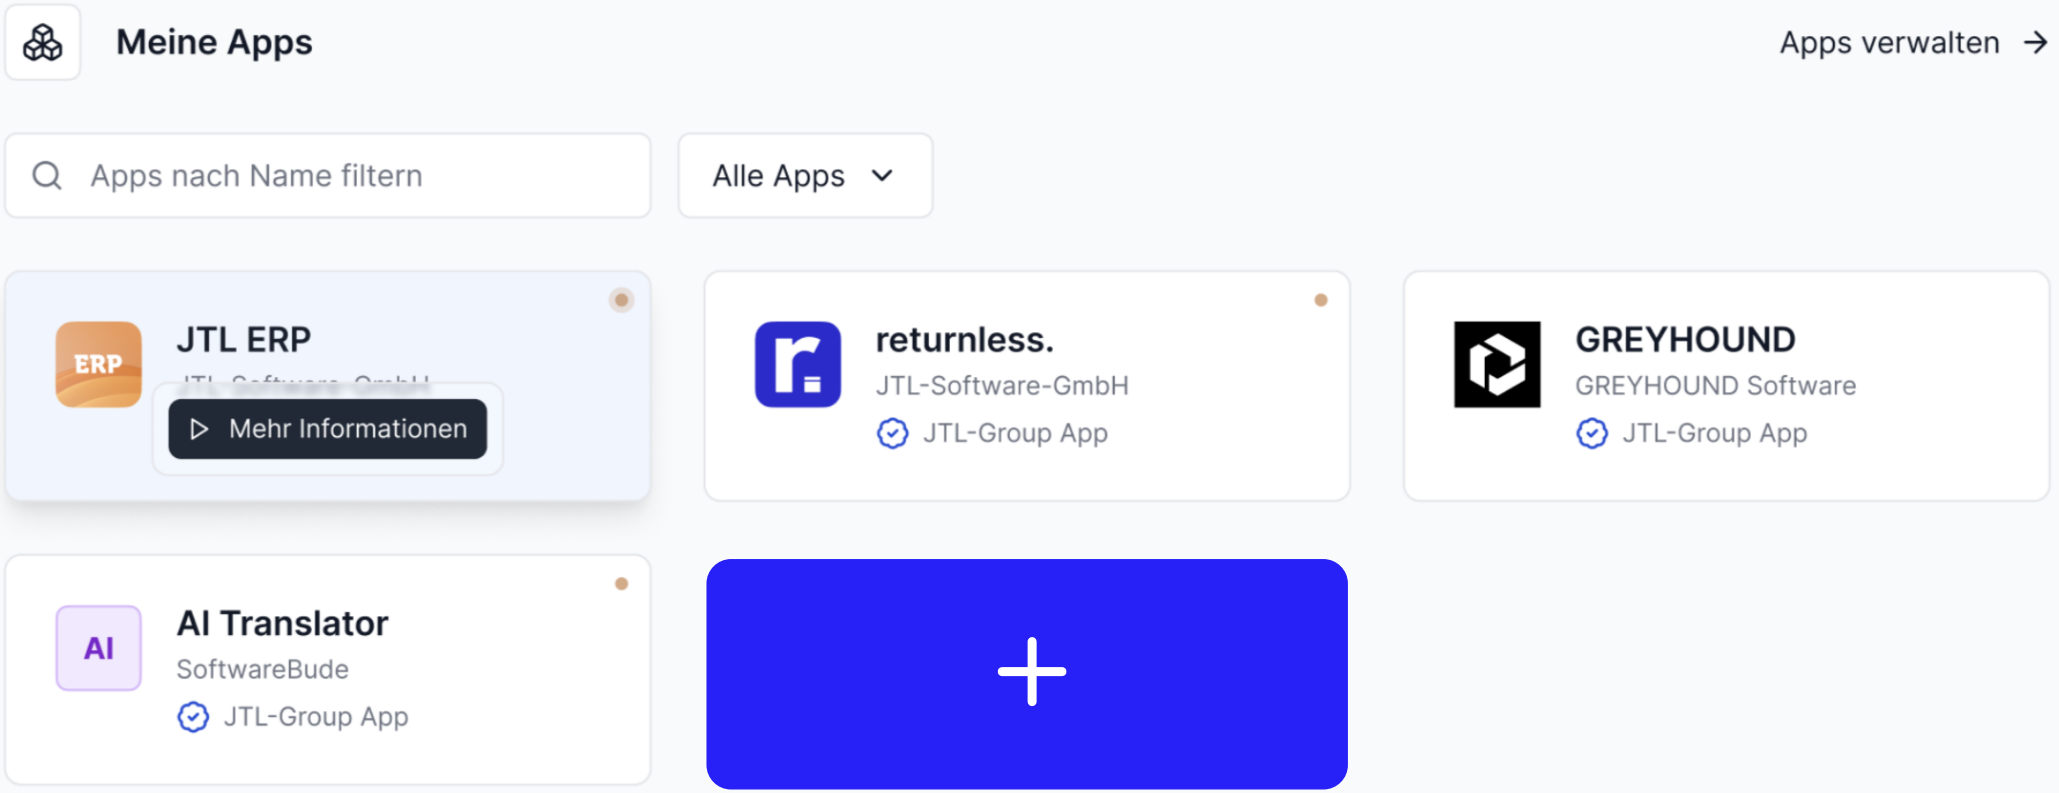

Headless integration

Backend service without UI. Listens to events and calls APIs — e.g. a webhook handler.

Cloud ERP Panel integration

Enhance the context of the Cloud ERP with your app specialized to the active context.

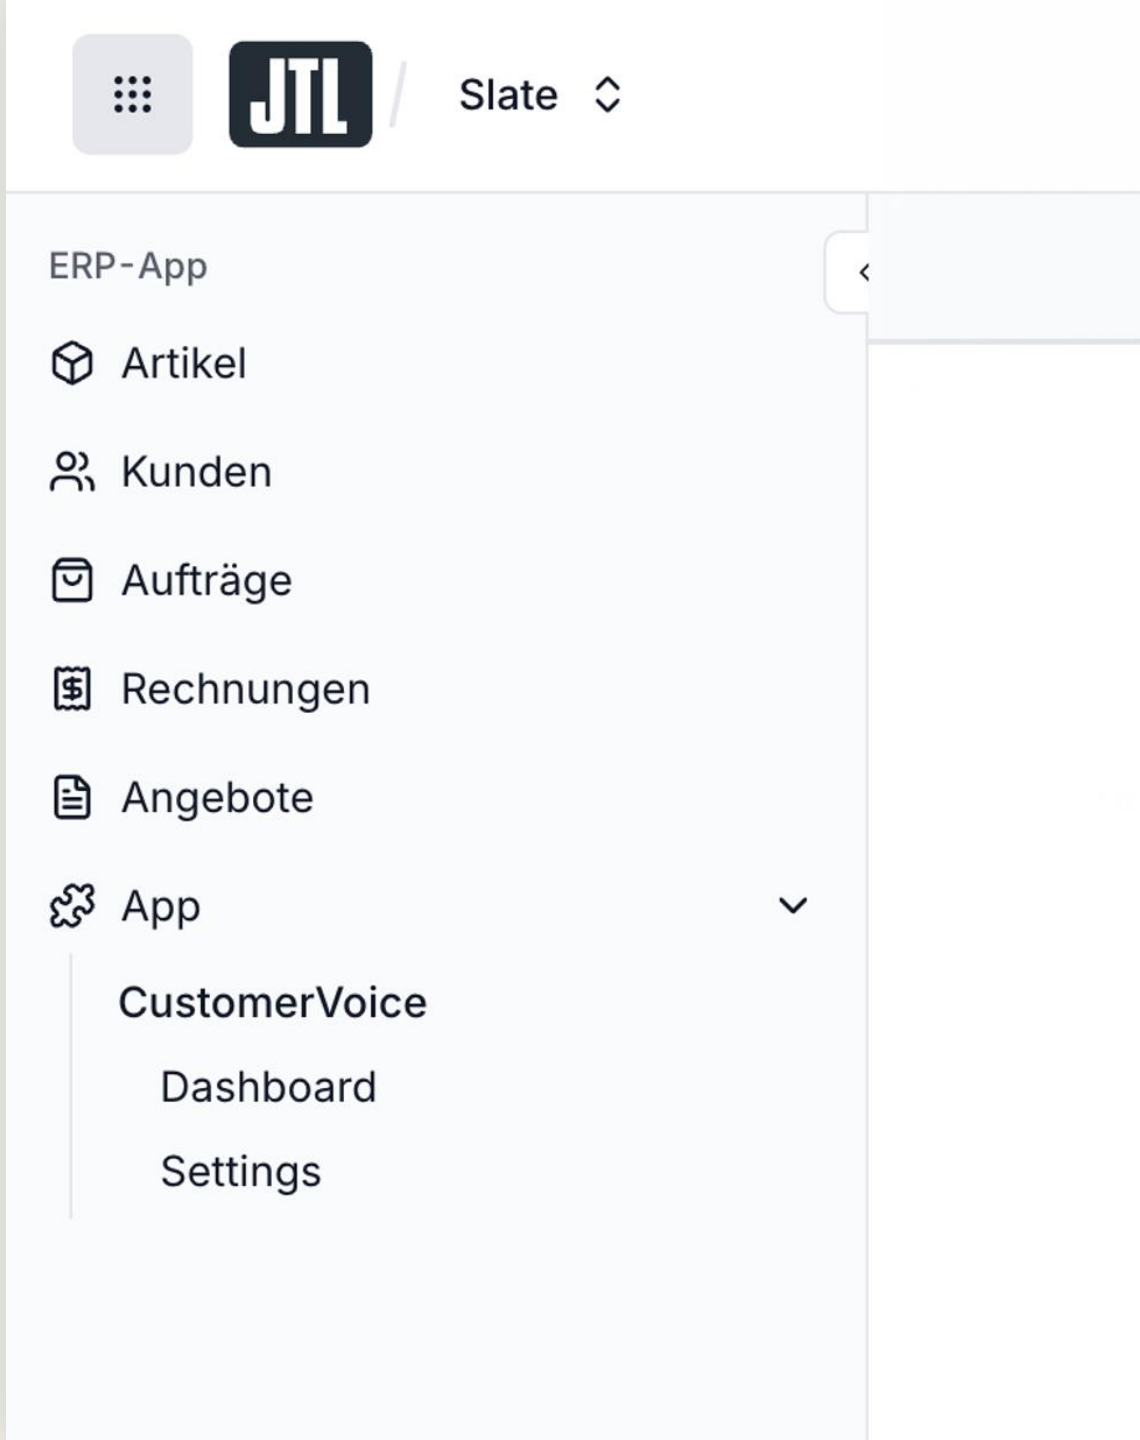

Cloud App capabilities: Hub Link

Your app as part of the JTL Hub App Dashboard.

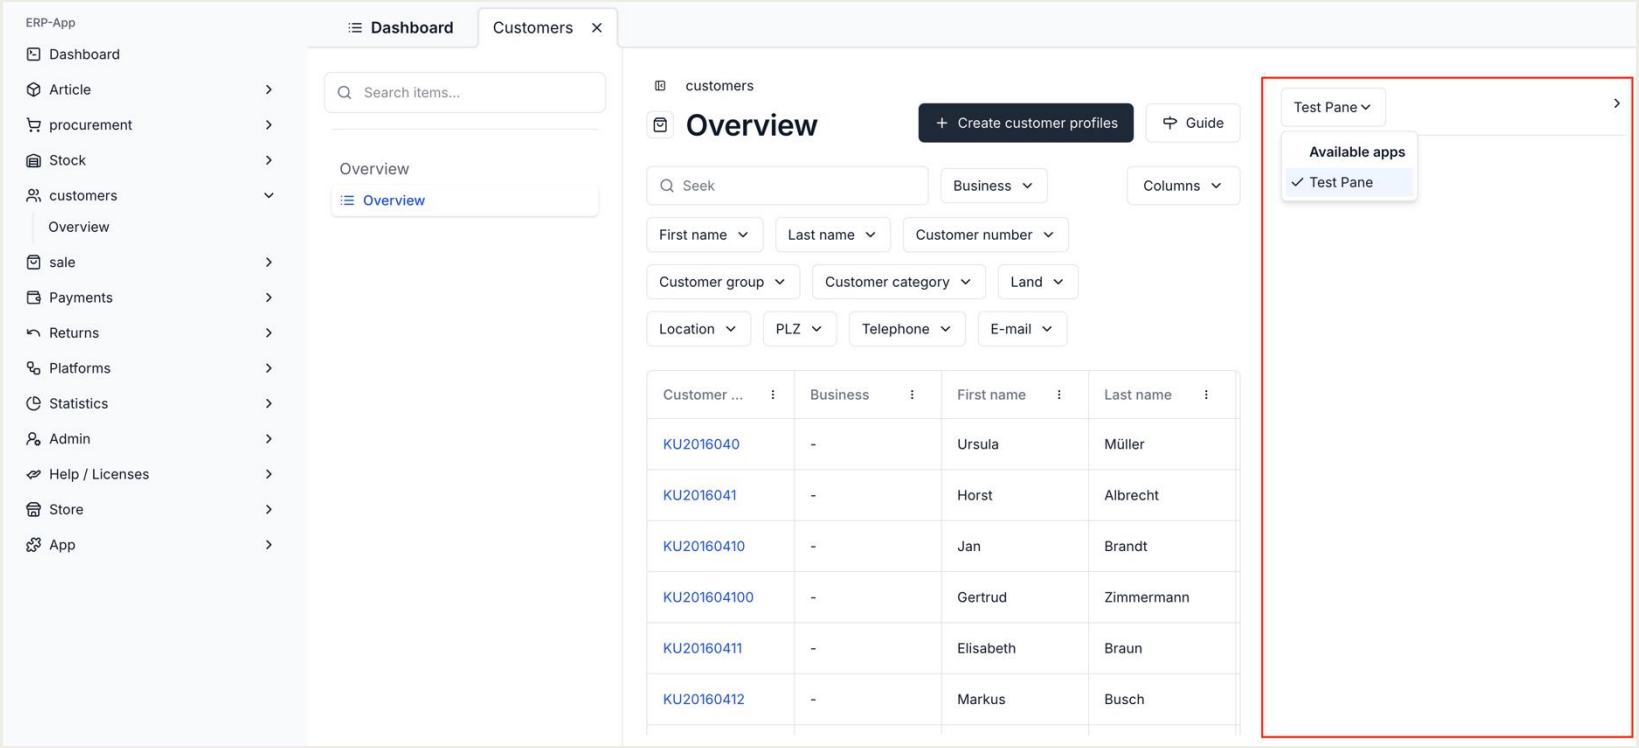

Cloud ERP Menu item.

Extend the Cloud ERP main menu with your own entry.

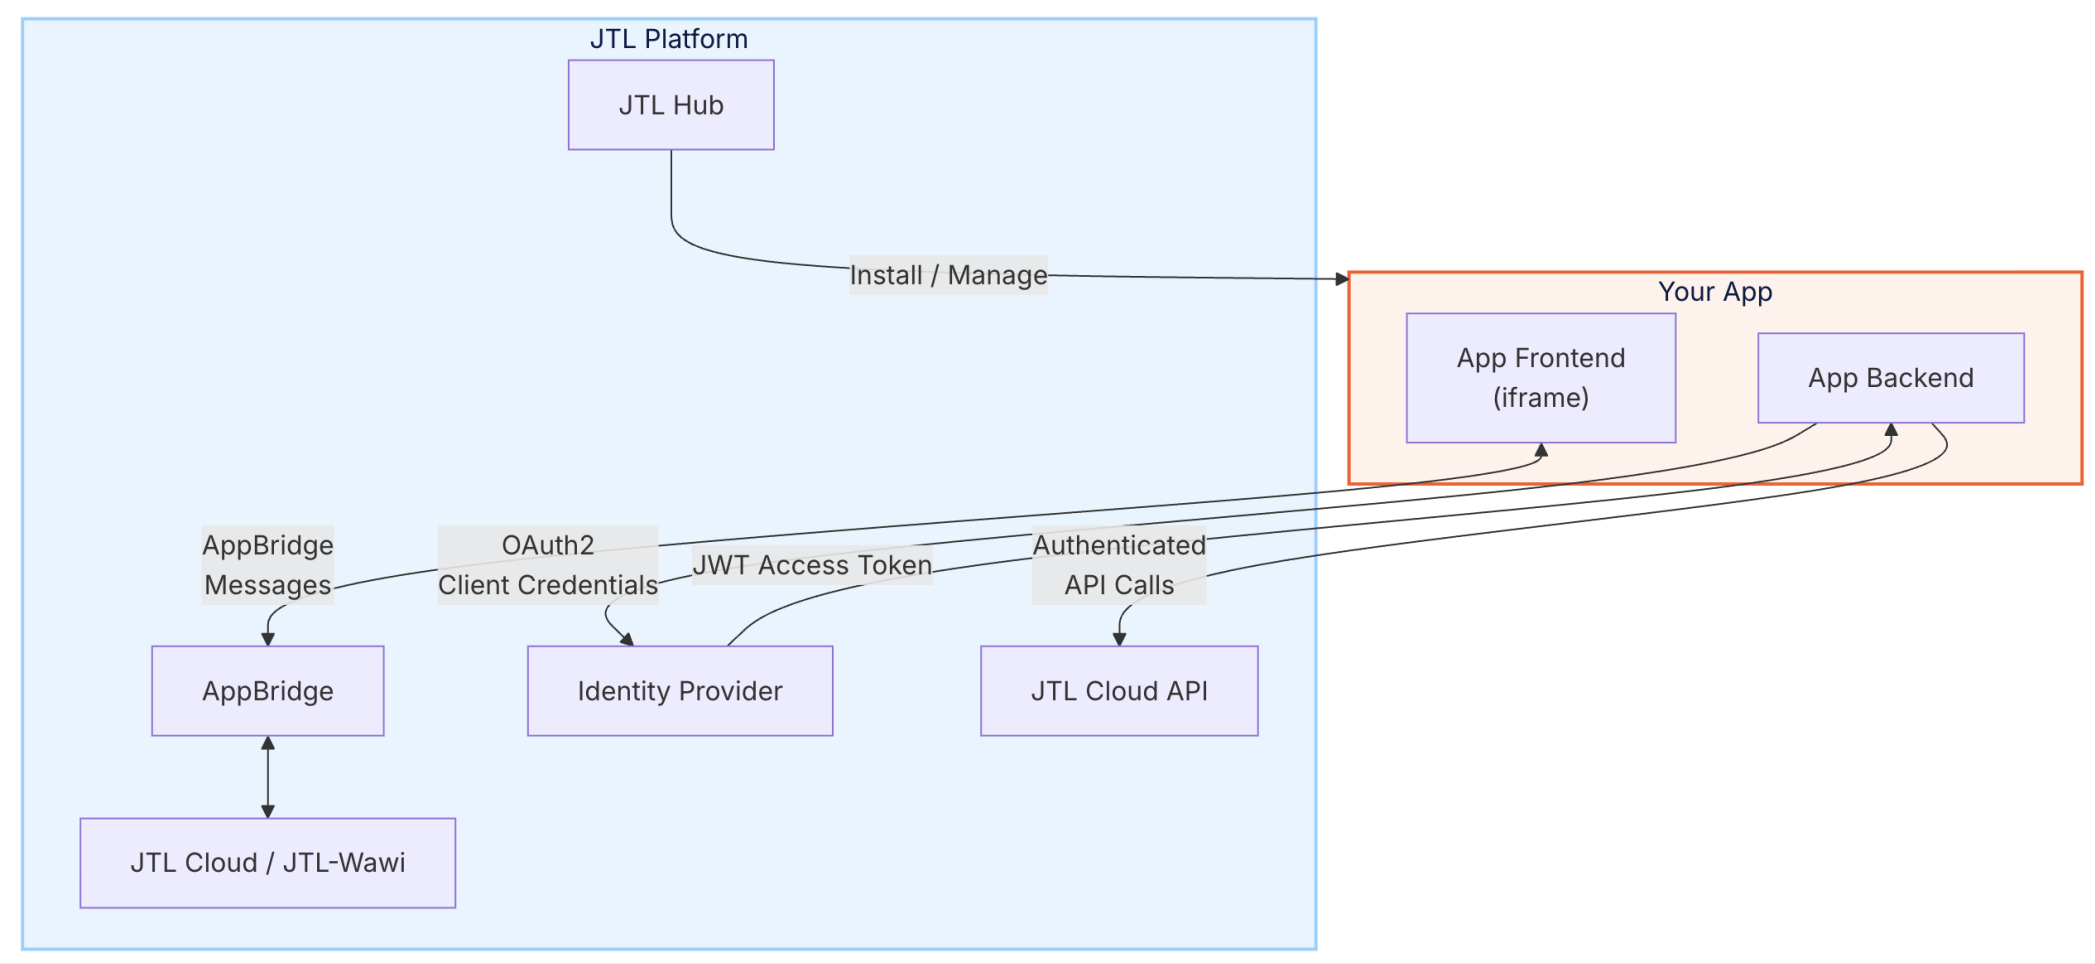

Cloud ERP Panel integration.

Embed your app right inside an existing Cloud screen.

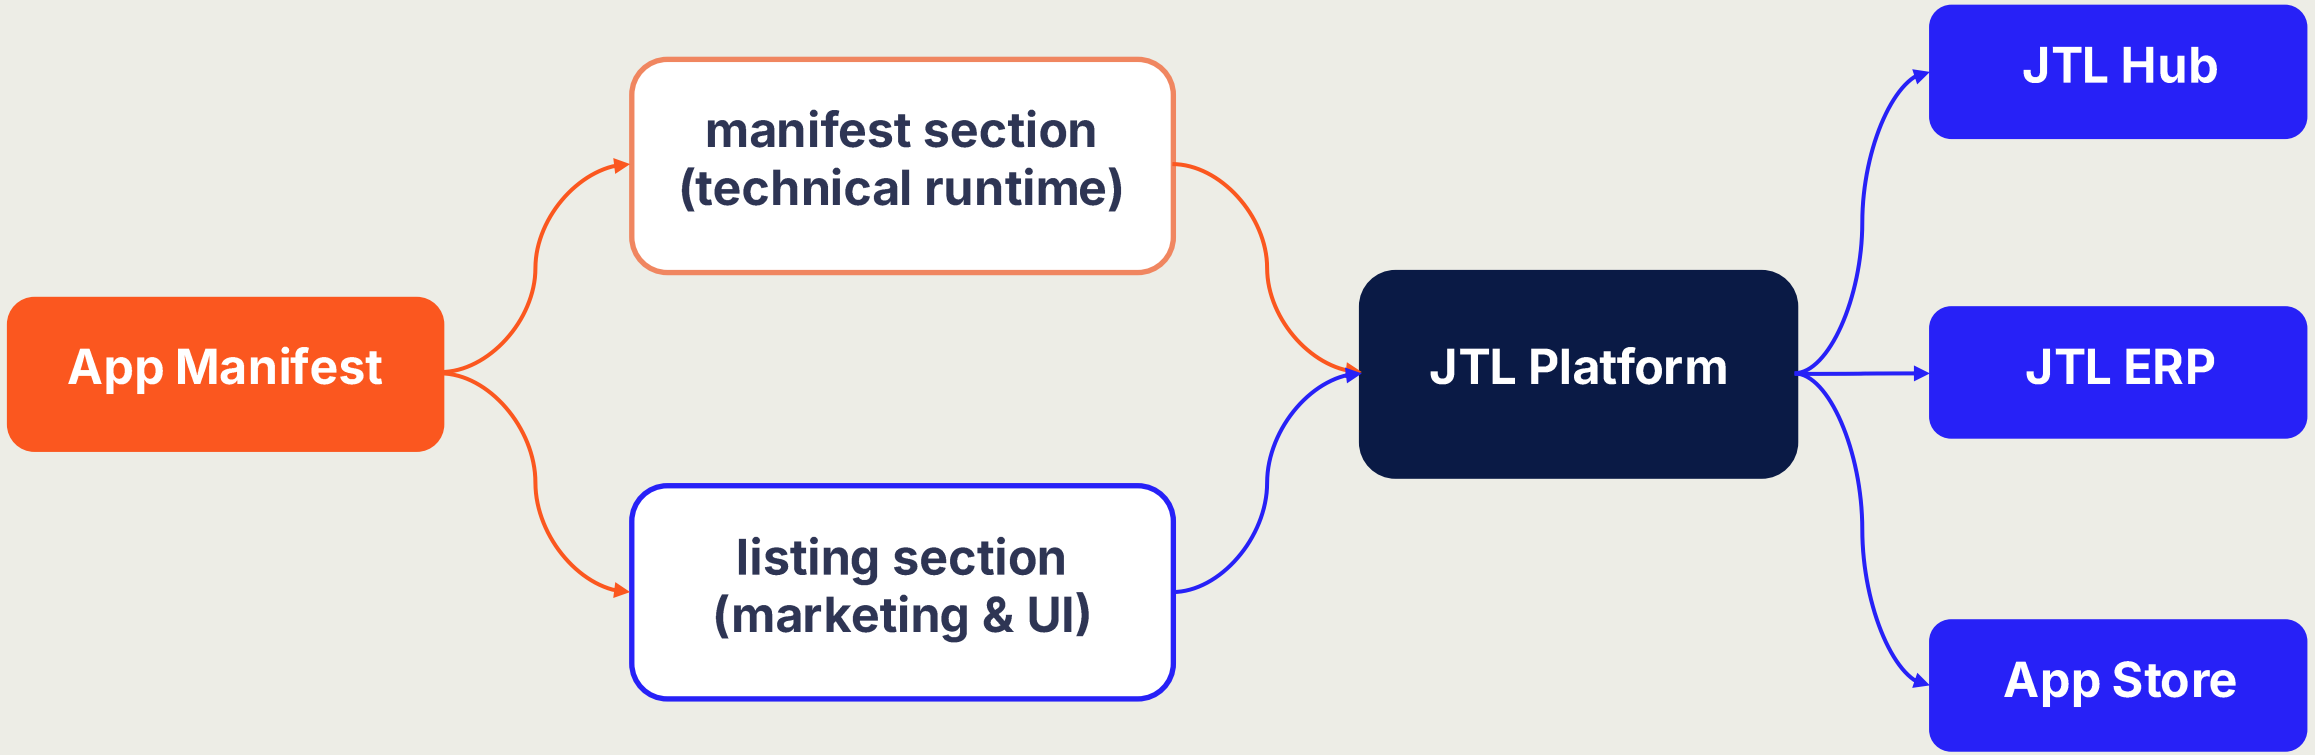

Your app as part of the JTL Cloud

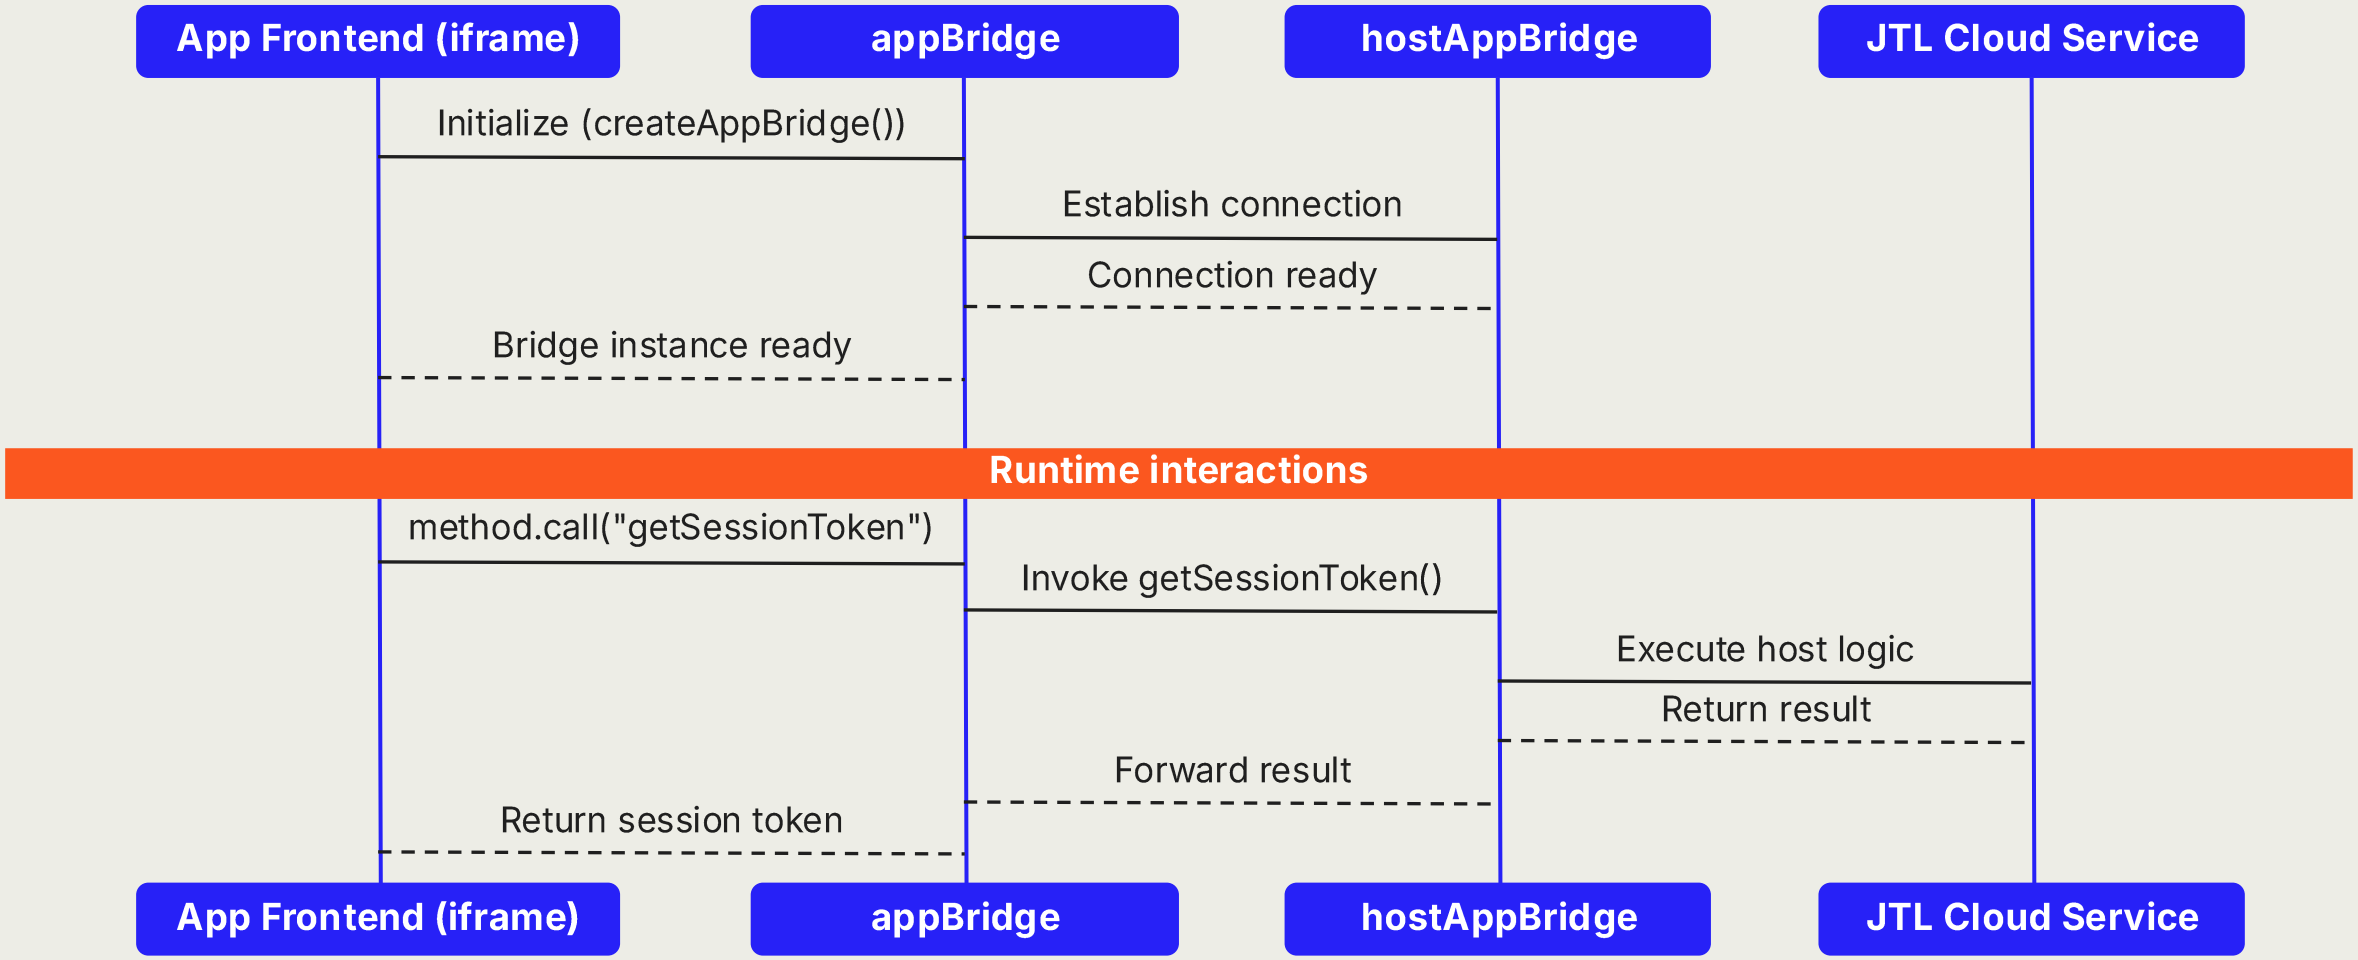

App Manifest

The JSON that defines your JTL Cloud App

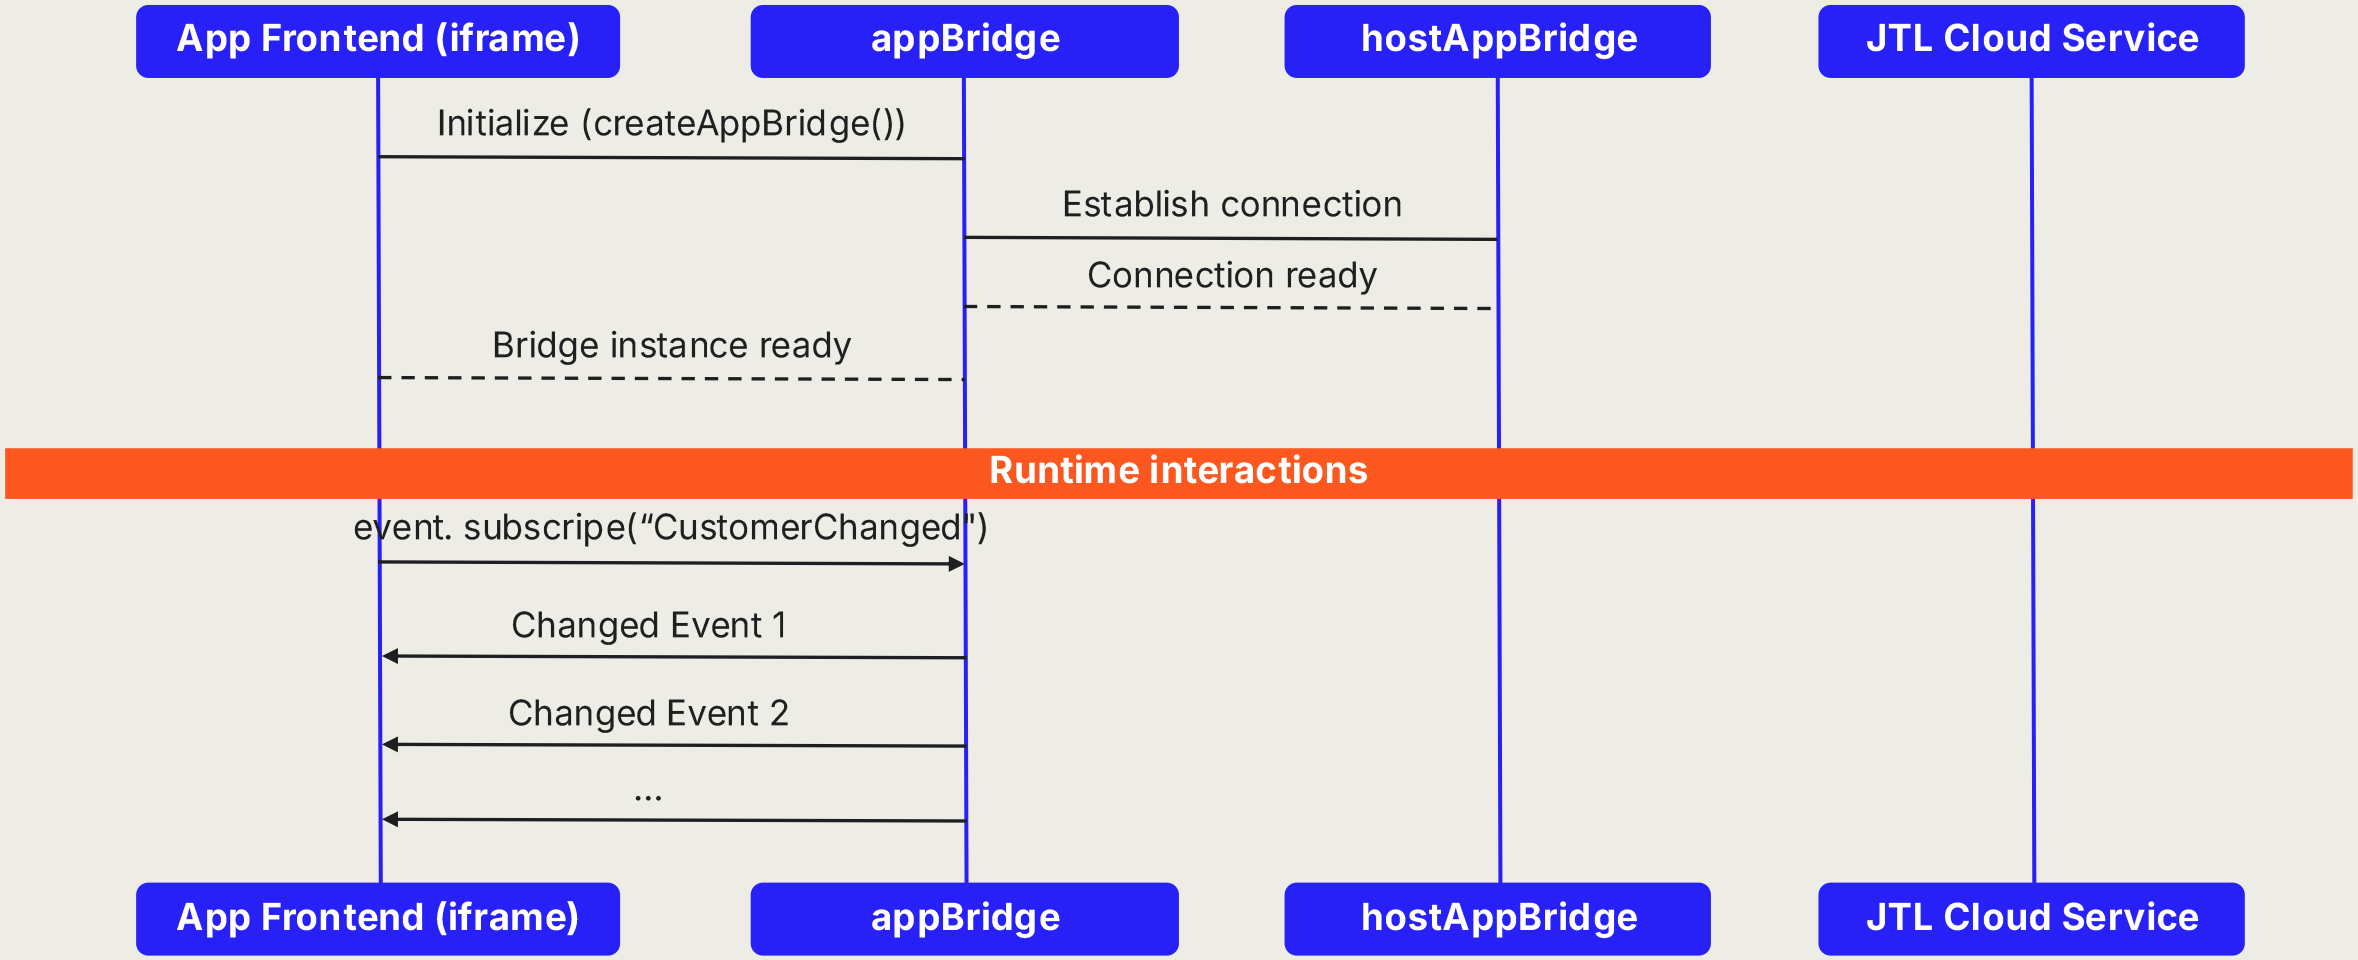

AppBridge.

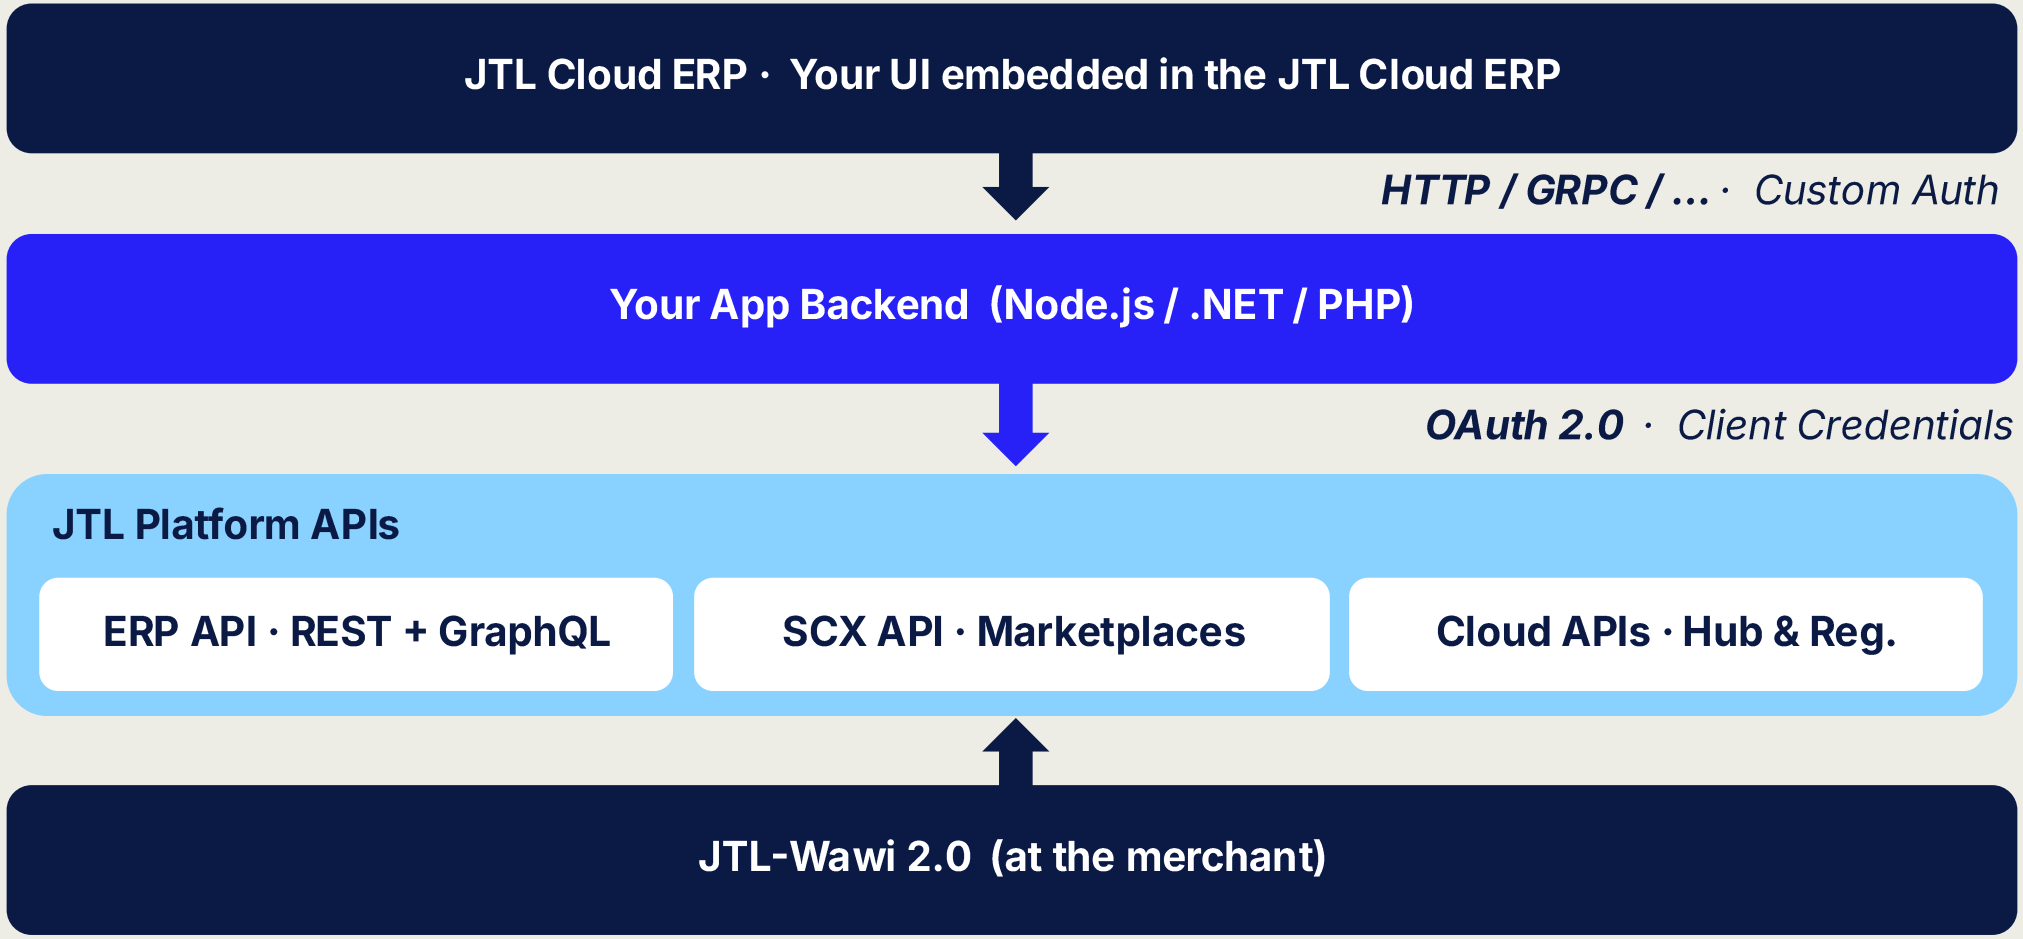

The thin layer that makes embedded apps feel native.

AppBridge.

The thin layer that makes embedded apps feel native.

The communication flow from app frontend to Wawi

Cloud App Authentication – the 2 challenges

#1 Single client credentials per app

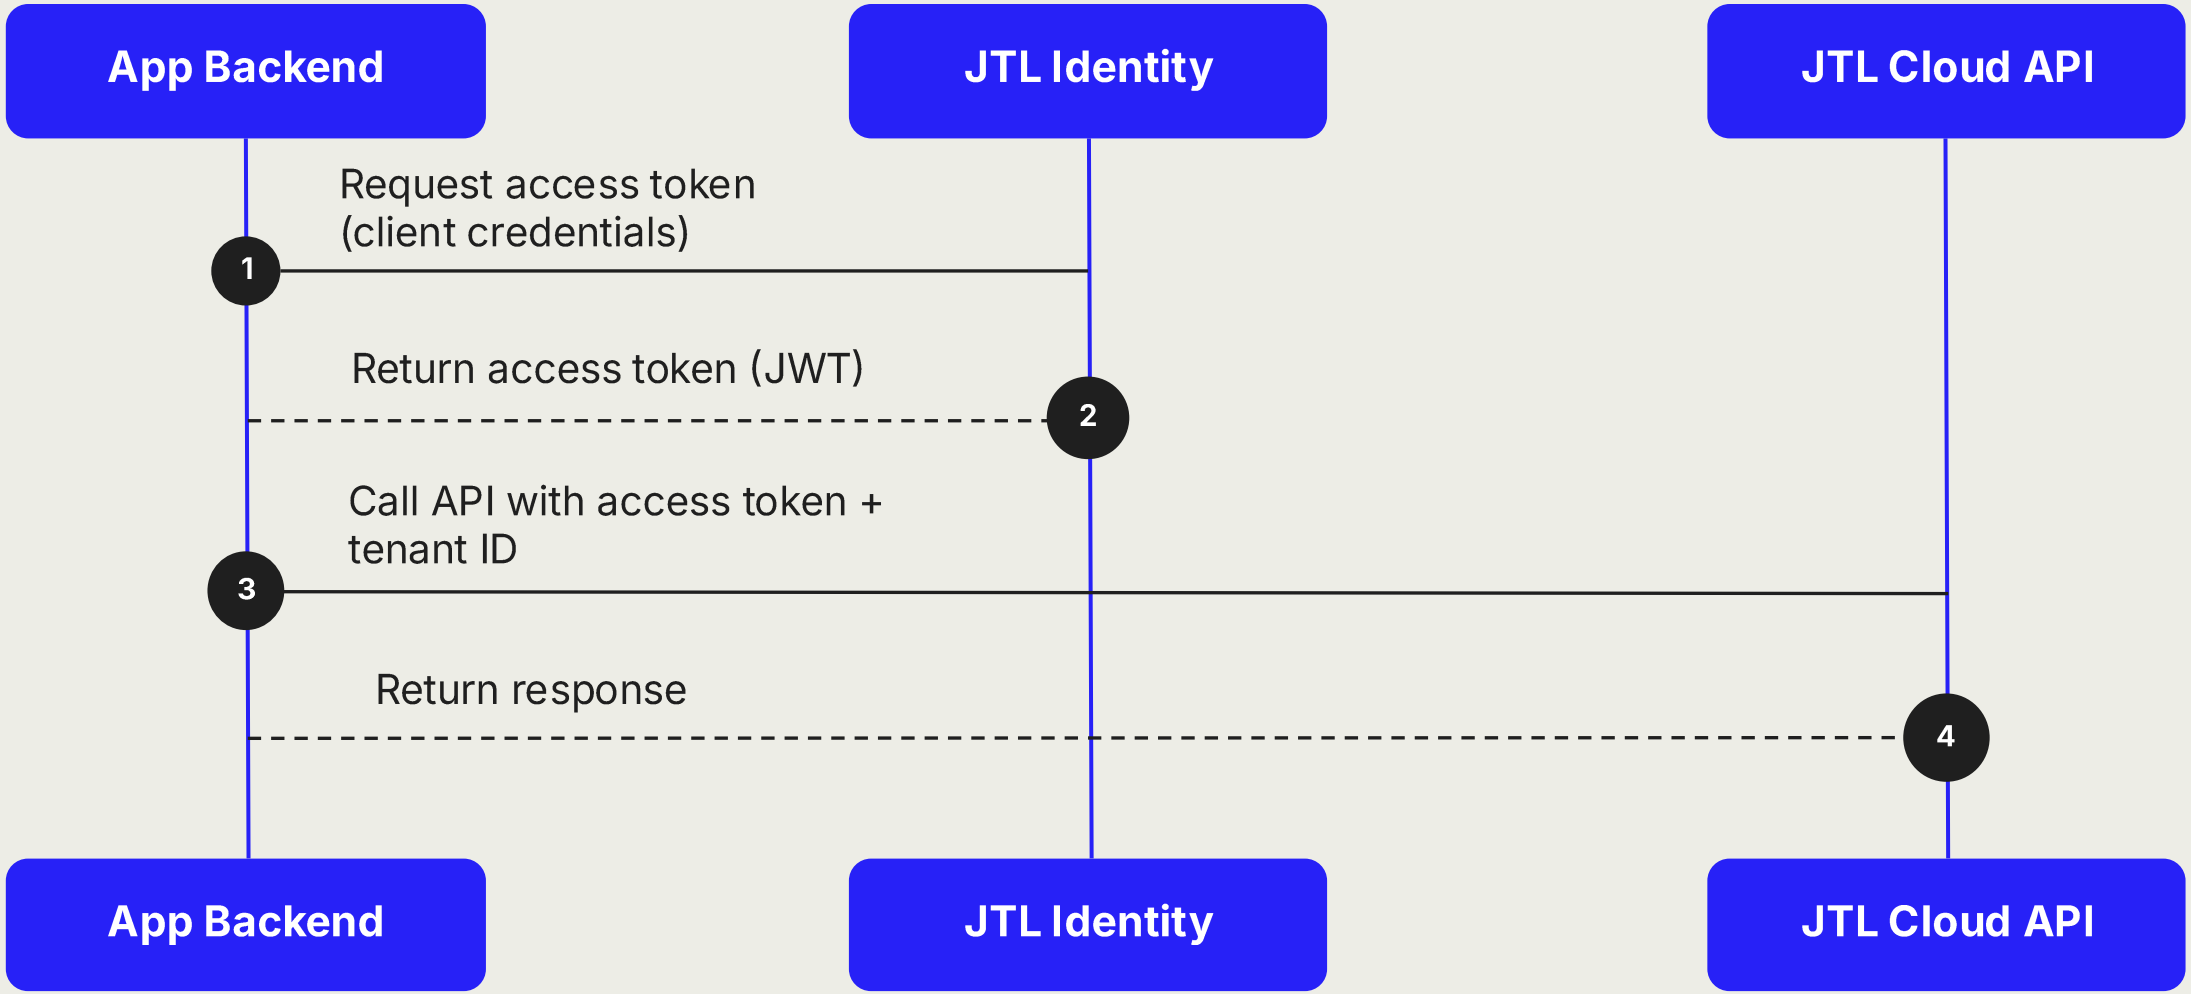

A JTL Cloud App has one set of client credentials.

Tenant isolation must therefore be ensured by the app developer, and an X-TENANT-ID header must be set on every request.

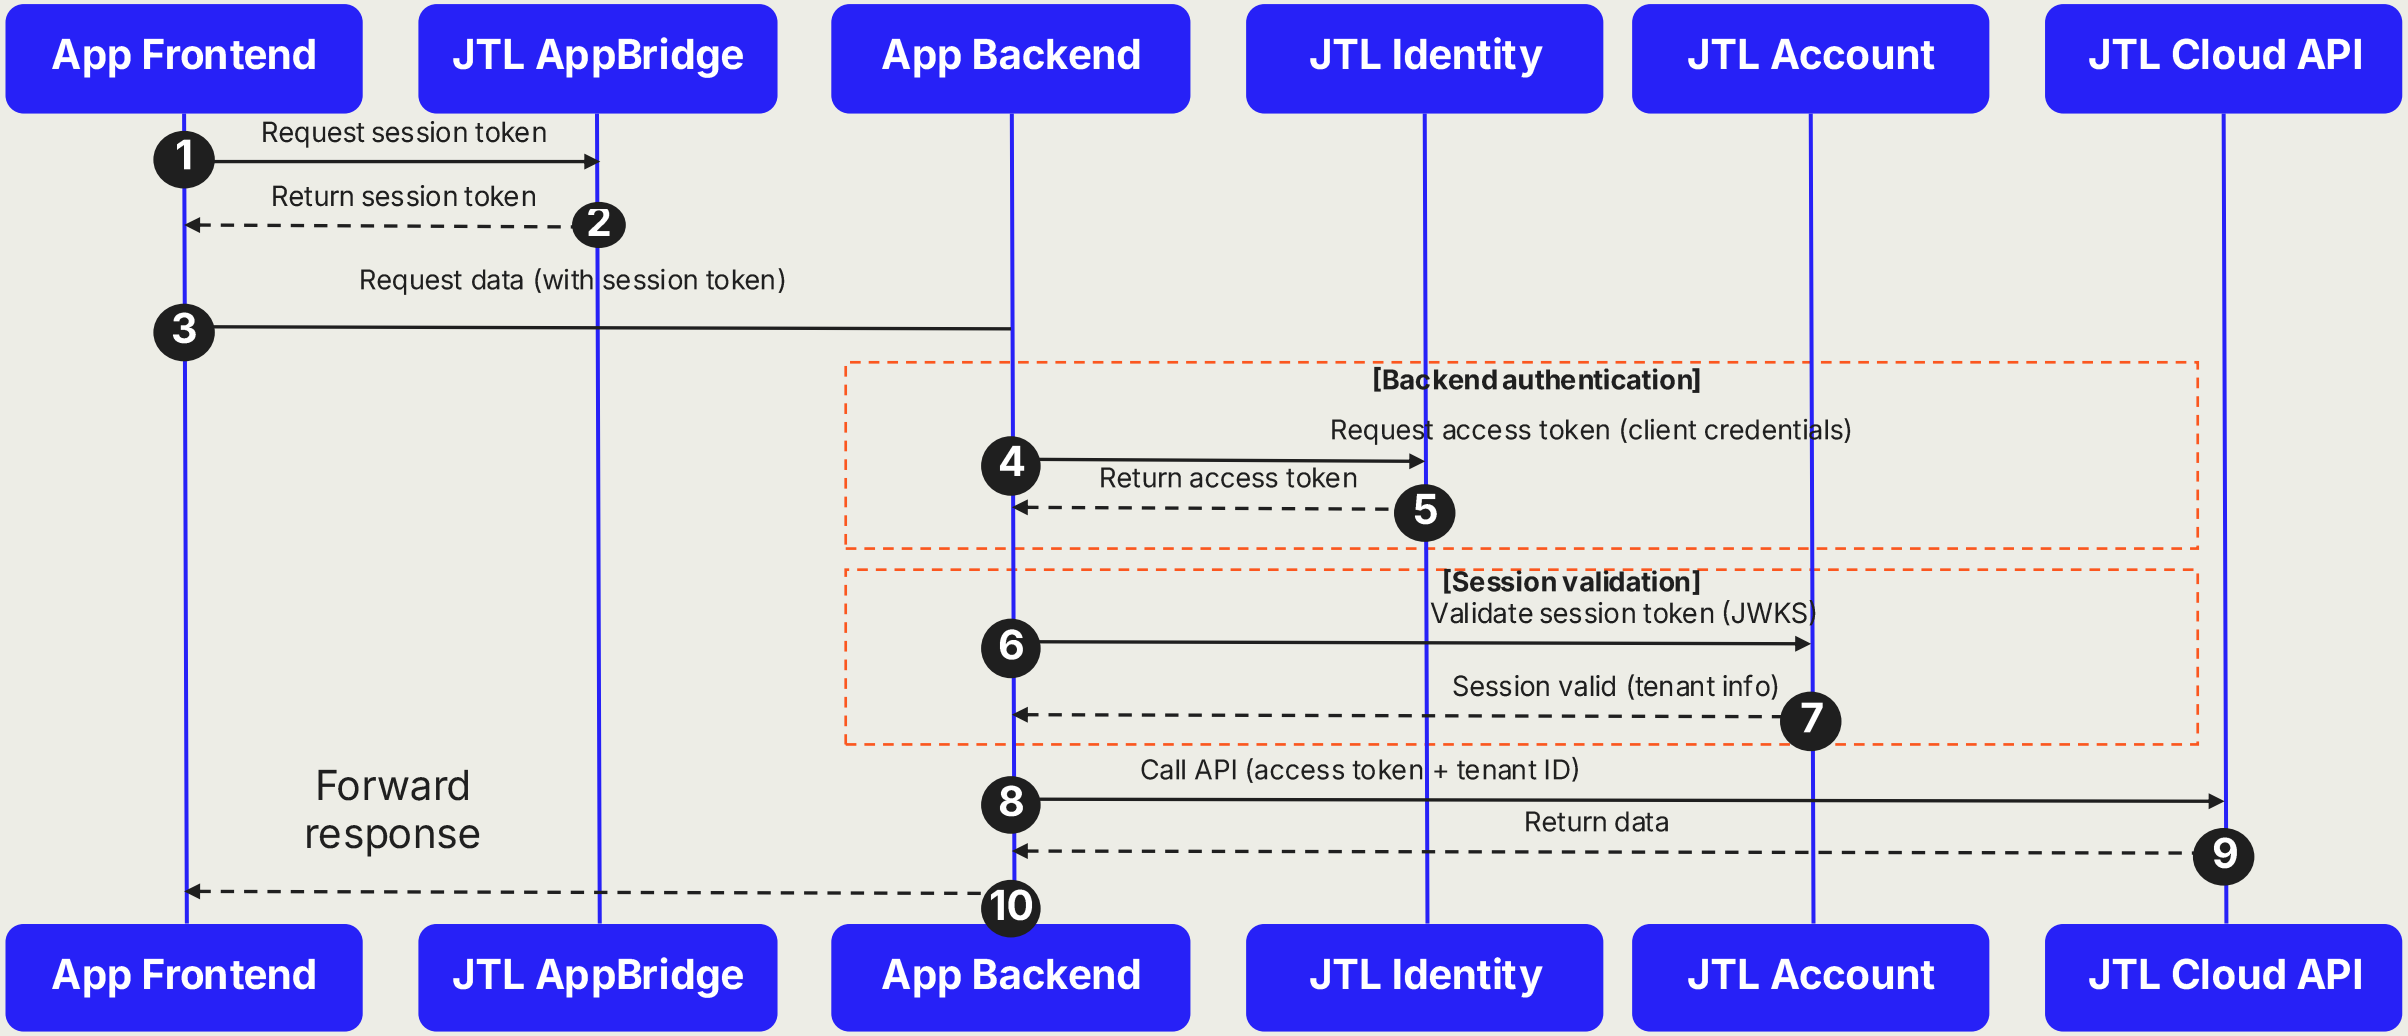

#2 Tenant mapping

The JTL Cloud tenant must be mapped to the application tenant of the JTL Cloud App.

Cloud App Authentication – single client credentials

Cloud App Authentication – session token

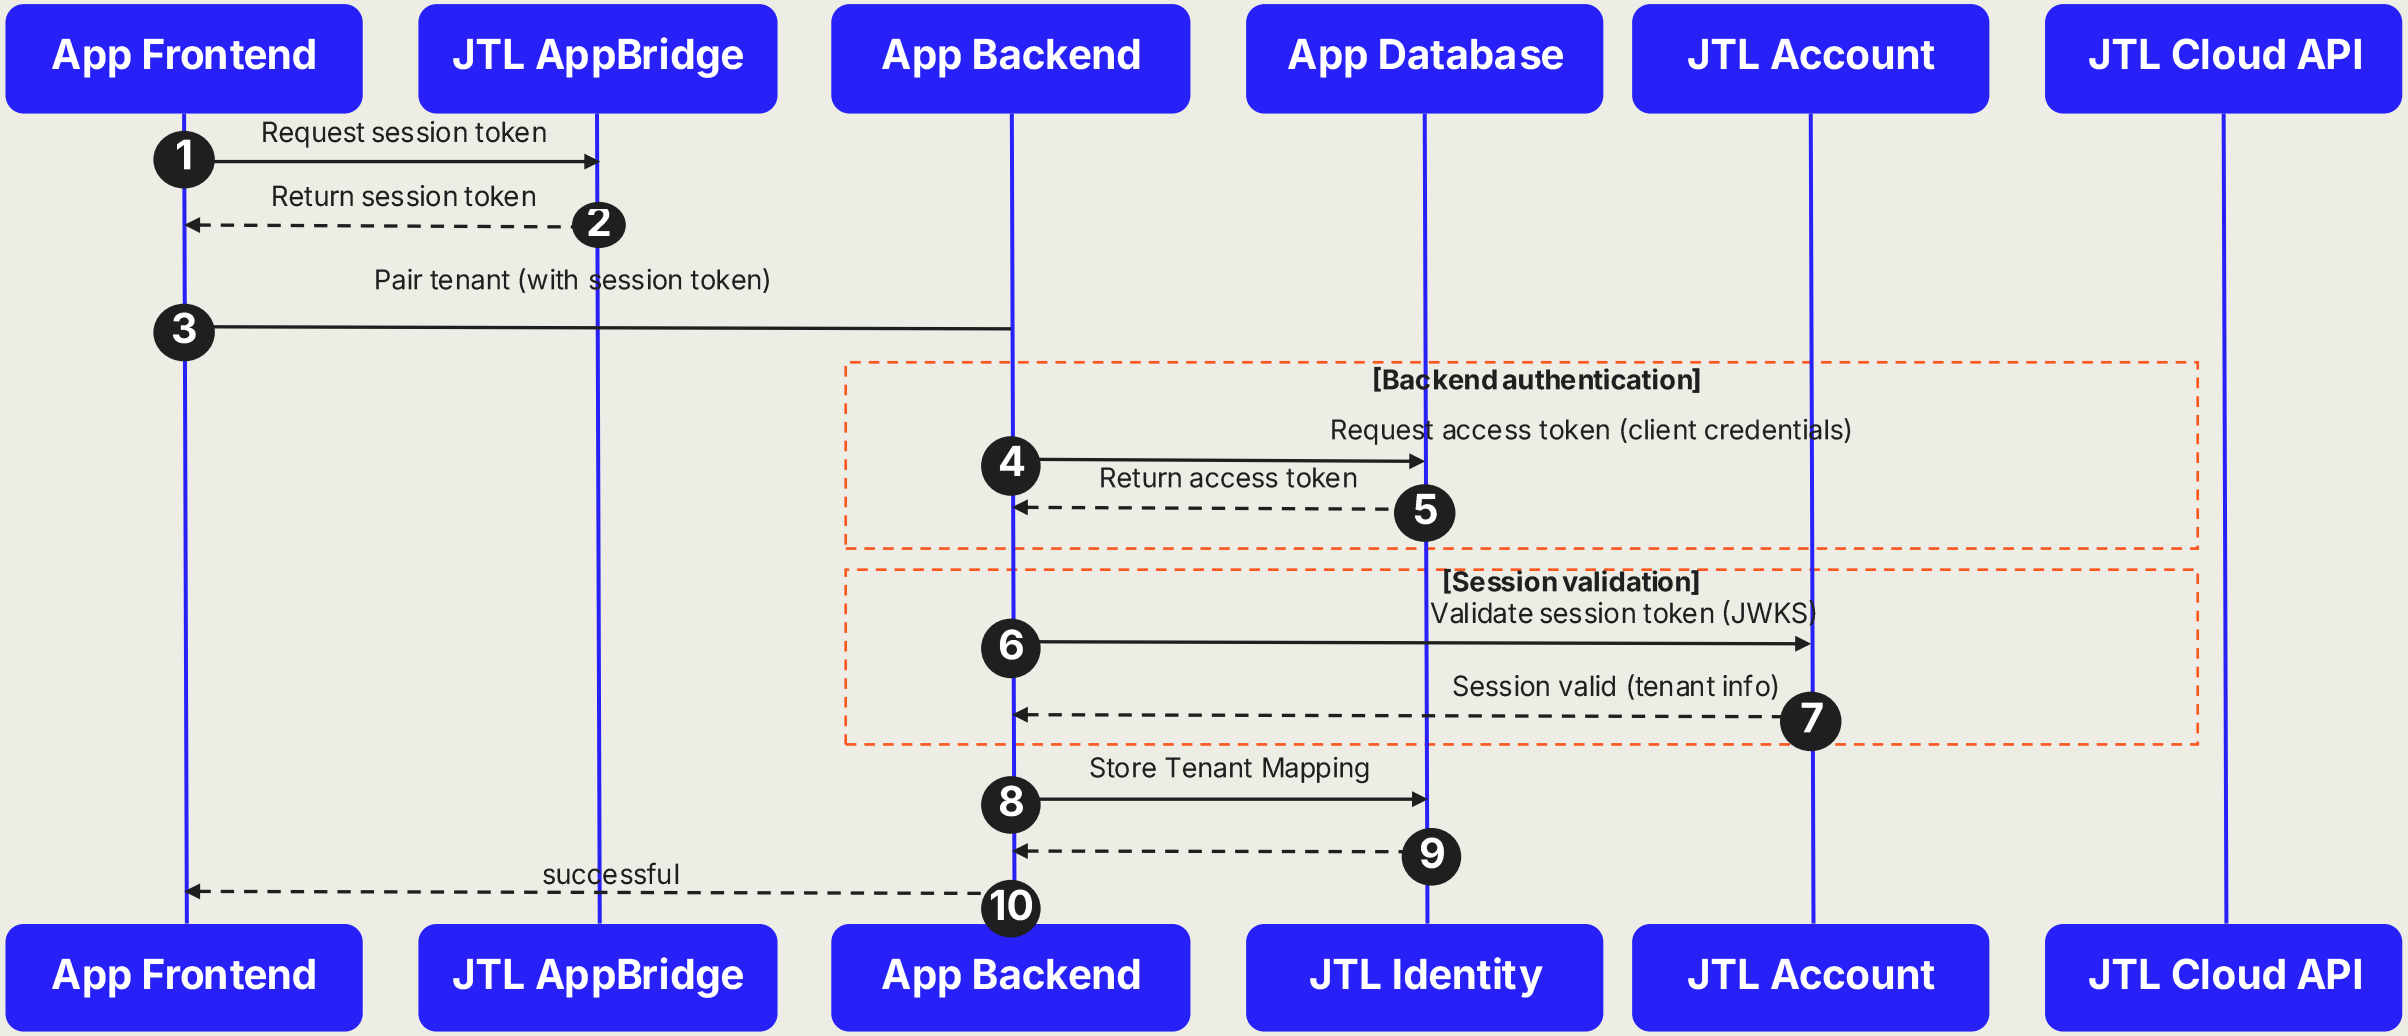

AppBridge: The SessionToken

        "tenantSlug": "<string>"
    },
    "signature": "fwjol6pXYkS7sXQ..."
}
```

AppBridge: The SessionToken

Tenant Mapping samples

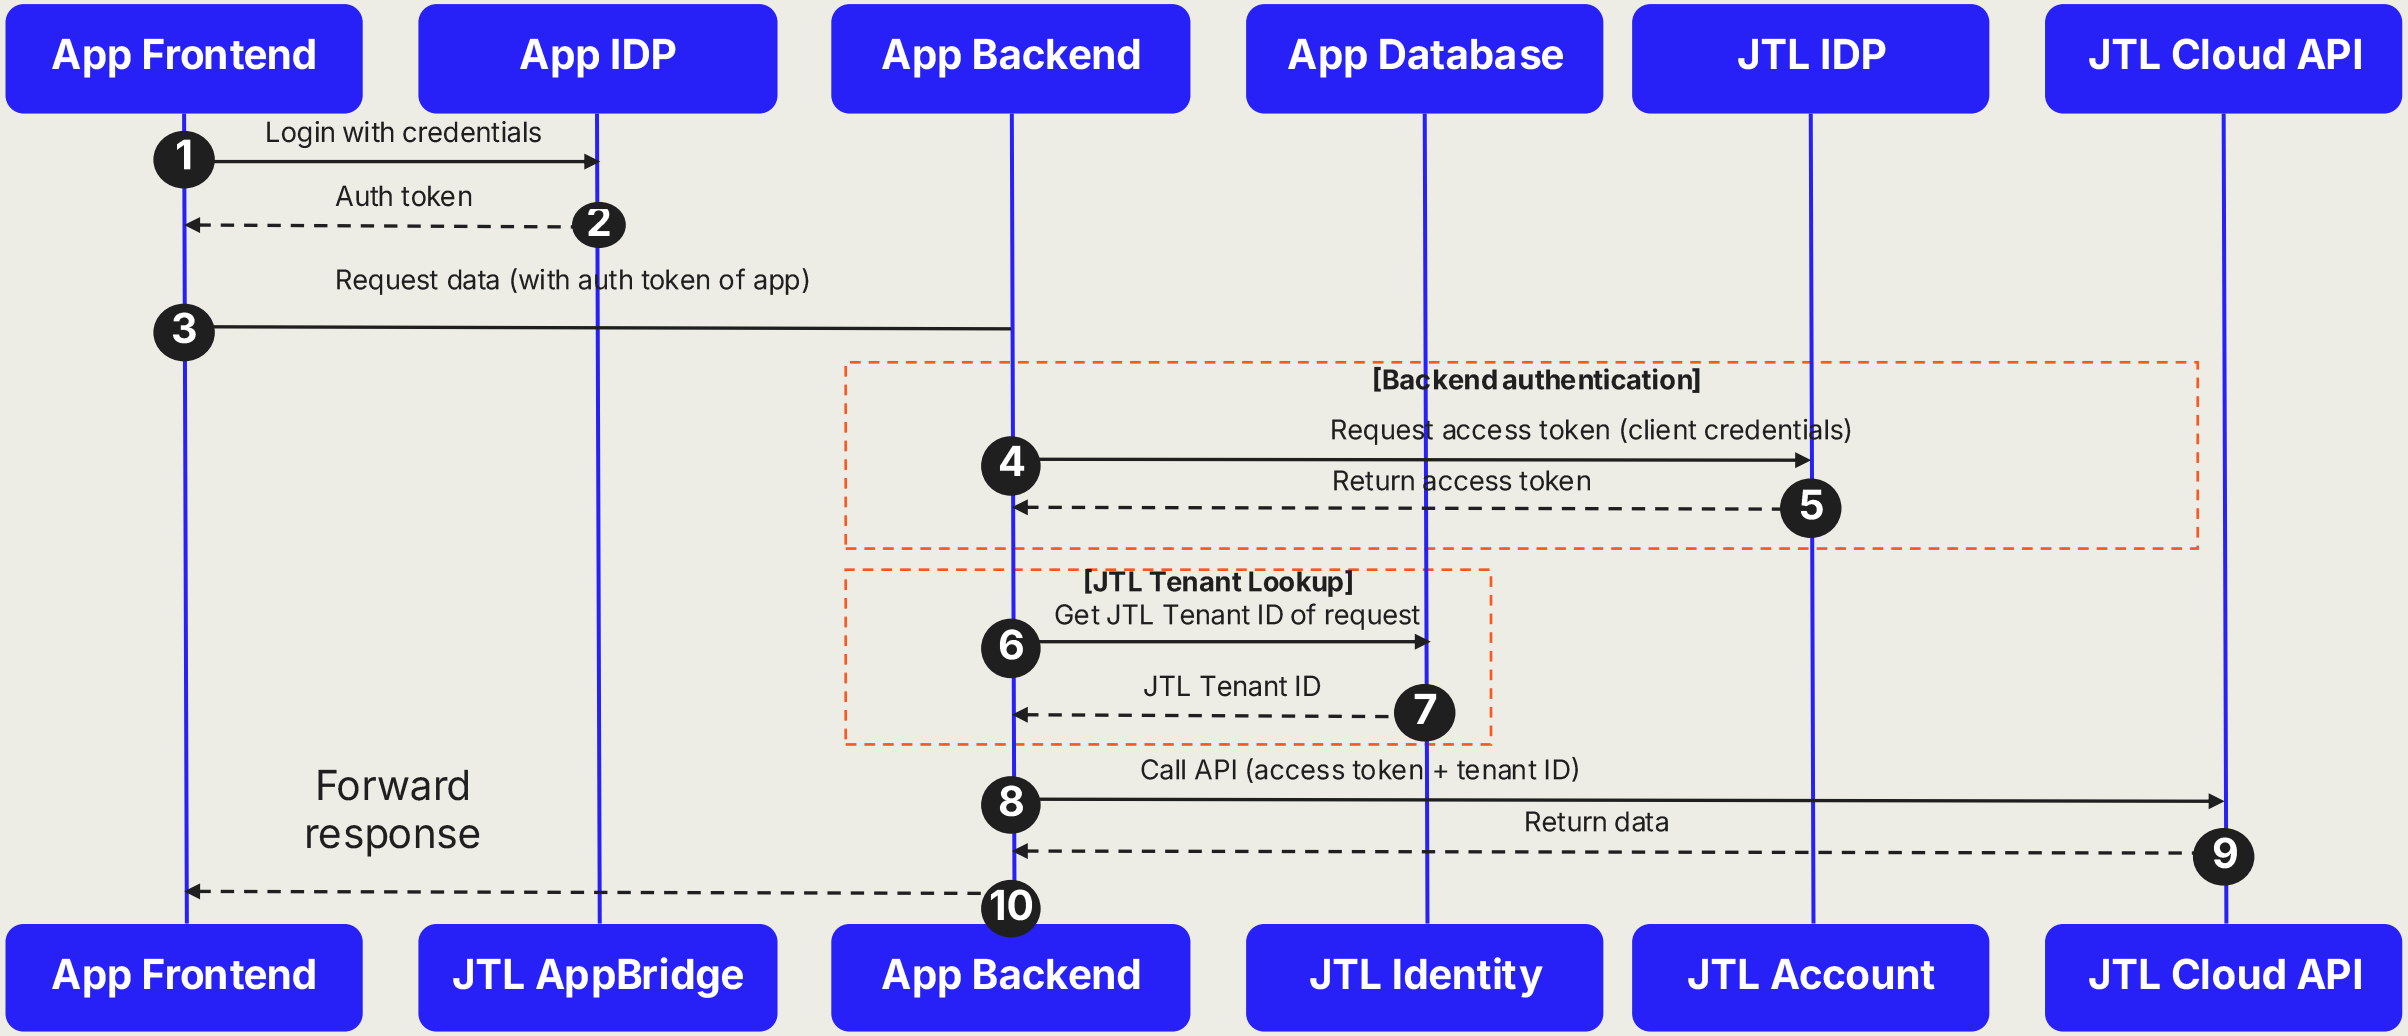

#1 Mapping database

TenantId	JTLCloudTenantId
app-tenant-a	a524fe5f-52ba-40d9-a270-0f91849b7e3a
...	...

#2 New Property for app tenant

```
{
        “tenantId”: “app-tenant-a”,
        “jtlCloudTenantId”: “a524fe5f-
52ba-40d9-a270-0f91849b7e3a”
}
```

Cloud App Authentication – tenant “pairing”

JTL

CHAPTER 03

What can you build as a developer?

Tech-stack options

→ **Frontend templates** for React (Cloud App Starter)

→ **Webhook handler template** for pure backend services

→ **SDKs:** JavaScript/TypeScript incl. React hooks, C#/.NET

→ **Official JTL CLI for auth**, scaffolding and app submission

JTL

CHAPTER 04

Hands-on. Build a JTL Cloud App.

Two quickstart paths · we'll take the fast one

From Template

- → 15 minutes to a working app
- → React starter with everything included
- → Manifest, auth flow and AppBridge pre-wired

This is the path we'll take.

From Scratch

- → In detail with Next.js
- → Full control over every building block
- → Wire up manifest, auth, AppBridge yourself

Bonus material for after the workshop.

Demo showcase: CustomerVoice

A lean **multi-tenant feedback management app** that serves as a reference implementation, demonstrating every relevant integration point of the JTL Cloud Platform in a single app.

What the app does

- **Capture feedback –** Customers rate articles in the shop (rating + comment) via an embeddable widget
- **Dashboard –** Merchants see all feedback centrally with KPI tiles (new feedback, ▮ rating, open, resolved)
- **Cloud ERP integration –** Context-aware view of feedback for the currently opened article or customer
- **Workflow –** Status workflow for processing: open → in progress → resolved
- **Configuration –** Per-tenant settings for shop name, contact email, and welcome message

JTL Cloud integration points

- **Hub link –** Entry point from the JTL Hub directly into the web app
- **Menu items –** Custom navigation items in the Cloud ERP (Dashboard & Configuration)
- **Side panels –** React to the currently opened article or customer in the ERP
- **Public widget (iFrame) –** Embeddable on shop article pages to capture feedback
- **Backend API access –** Calls JTL Cloud APIs from the backend using the session token

JTL

CHAPTER 05

Handoff to the Hackathon.

Your task and where to look things up

Your Task

By the end of day 2, a working prototype in the Hub.

Required
one API call against the Platform API plus a visualization in the Hub

Teams of two or three are allowed and encouraged.

Bonus
lifecycle webhook, your own settings page, or real Wawi actions
